fontspec.dtx

1 Package declaration

List all dtx files for running the ins file and typesetting the code.

```
 1  {*dtx}

```

File II

fontspec-code-load.dtx

1 The `fontspec.sty` loading file

Before we begin, for the rest of the package we use the `\Expl3` module syntax with module name ‘`fontspec`’.

```
1 <@@=fontspec>
```

The `fontspec.sty` file is simply set up to load the appropriate `fontspec-xetex.sty` or `fontspec-luatex.sty` file. This is performed by the following code.

```
2 {*load}
```

Lua^AT_EX

```
3 \sys_if_engine_luatex:T
4 {
5     \RequirePackage{luatofload}
6     \directlua{require("fontspec")}
7     \RequirePackageWithOptions{fontspec-luatex}
8     \endinput
9 }
```

X^ET_EX

```
10 \sys_if_engine_xetex:T
11 {
12     \RequirePackageWithOptions{fontspec-xetex}
13     \endinput
14 }
```

Other If not one of the above, error and exit.

```
15 \msg_new:nnn {fontspec} {cannot-use-pdfTeX}
16 {
17     The~ fontspec~ package~ requires~ either~ XeTeX~ or~ LaTeX.\ \\
18     You~ must~ change~ your~ typesetting~ engine~ to,~ e.g.,~
19     "xelatex"~ or~ "lualatex"~ instead~ of~ "latex"~ or~ "pdflatex".
20 }
21 \msg_fatal:nn {fontspec} {cannot-use-pdfTeX}
```

Closing That’s the end of the `fontspec.sty` file.

```
22 \endinput
23 </load>
```

File III

fontspec-code-vars.dtx

1 Declaration of variables

This file consists solely of declaration of variables used by fontspec. In some cases these variables are also initialised with default values. In time I would like to move these initialisations

Booleans

\l_@@_firsttime_bool As \keys_set:nn is run multiple times, some of its information storing only occurs once while we decide if the font family has been defined or not. When the later processing is occurring per-shape this no longer needs to happen; this is indicated by the 'firsttime' conditional.

```
1 \bool_new:N \l_@@_firsttime_bool  
(End definition for \l_@@_firsttime_bool. This function is documented on page ??.)  
2 \bool_new:N \l_@@_nobf_bool  
3 \bool_new:N \l_@@_noit_bool  
4 \bool_new:N \l_@@_nosc_bool  
5 \bool_new:N \l_@@_check_bool  
6 \bool_new:N \l_@@_tfm_bool  
7 \bool_new:N \l_@@_atsui_bool  
8 \bool_new:N \l_@@_ot_bool  
9 \bool_new:N \l_@@_mm_bool  
10 \bool_new:N \l_@@_graphite_bool  
11 \bool_new:N \l_@@_fontcfg_bool  
12 \bool_set_true:N \l_@@_fontcfg_bool
```

For dealing with legacy maths:

```
13 \bool_new:N \g_@@_math_euler_bool  
14 \bool_new:N \g_@@_math_lucida_bool  
15 \bool_new:N \g_@@_pkg_euler_loaded_bool
```

For package options:

```
16 \bool_new:N \g_@@_cfg_bool  
17 \bool_new:N \g_@@_math_bool  
18 \bool_new:N \g_@@_euenc_bool  
19 \bool_new:N \l_@@_tmpa_bool  
20 \bool_new:N \l_@@_disable_defaults_bool  
21 \bool_new:N \l_@@_alias_bool  
22 \bool_new:N \l_@@_external_bool  
23 \bool_new:N \l_@@_defining_encoding_bool  
24 \bool_new:N \l_@@_scriptlang_exist_bool  
25 \bool_new:N \g_@@_em_normalise_slant_bool  
26 \bool_new:N \l_@@_proceed_bool  
27 \bool_new:N \l_@@_check_feat_bool
```

\l_@@_never_check_bool It is used to disable checking opentype script, language, and tags when running checking code that has a user-defined return path we want to allow the higher-level code to dictate the logic.
TODO: tidy this up!

28 \bool_new:N \l_@@_never_check_bool

(End definition for \l_@@_never_check_bool. This function is documented on page ??.)

\l_@@_scripts_missing_bool True for a regular opentype font with at least the DFLT script. False for a font lacking all script (and therefore language and feature) tags.

29 \bool_new:N \l_@@_scripts_missing_bool

(End definition for \l_@@_scripts_missing_bool. This function is documented on page ??.)

48 \RequirePackage[\g_fontsencoding_tl]{fontenc}
49 \tl_set_eq:NN \UTFencname \g_fontsencoding_tl % for xunicode if needed

```

To overcome the encoding changing the current font size, but only if a class has been loaded first:

```
50 \tl_if_in:NnT \@filelist {.cls} { \normalsize }
```

Dealing with a couple of the problems introduced by babel:

```

51 \tl_set_eq:NN \cyrillicencoding \g_fontsencoding_tl
52 \tl_set_eq:NN \latinencoding \g_fontsencoding_tl
53 \AtBeginDocument
54 {
55   \tl_set_eq:NN \cyrillicencoding \g_fontsencoding_tl
56   \tl_set_eq:NN \latinencoding \g_fontsencoding_tl
57 }

```

That latin encoding definition is repeated to suppress font warnings. Something to do with `\select@language` ending up in the `.aux` file which is read at the beginning of the document.

```

58 \bool_if:NT \g_@@_euenc_bool
59 {
60 <LU> \cs_set_eq:NN \fontspec_tmp: \XeTeXpicfile

1 User command internals

1.1 Font selection

\@@_main_fontspec:nn This is the main command of the package that selects fonts with various features. It takes two arguments: the font name and the optional requested features of that font.

```
1 \cs_new:Nn \@@_main_fontspec:nn
2 {
3     \fontspec_set_family:Nnn \f@family {#1} {#2}
4     \fontencoding {\g_@@_nfss_enc_t1}
5     \selectfont
6 }
```

(End definition for \@@_main_fontspec:nn. This function is documented on page ??.)

\setmainfont The following three macros perform equivalent operations setting the default font for a particular family: ‘roman’, sans serif, or typewriter (monospaced).

They end with \normalfont so that if they’re used in the document, the change registers immediately.

```
7 \cs_new:Nn \@@_main_setmainfont:nn

`\@@_main_newfontfamily:nnnN` The inner fontspec workings define a font family, which is then used in a typical NFSS `\fontfamily` declaration, saved in the macro name specified. The fourth argument determines which xparse function to set the macro with (new/renew/etc).

```

99  \cs_new:Nn \@@_main_newfontfamily:nnnN

`\@@_main_newfontface:nnn` `\newfontface` uses the fact that if the argument to `BoldFont`, etc., is empty (*i.e.*, `BoldFont={}`), then no bold font is searched for.

```

(End definition for `\@@_set_default_features:nn`. This function is documented on page ??.)

`\@@_set_font_default_features:nnn` The optional argument `#2` specifies font identifier(s). Branch for either (a) single token input such as `\rmdefault`, or (b) otherwise assume its a fontname. In that case, strip spaces and file extensions and lower-case to ensure consistency.

- `\addfontfeatures` In order to be able to extend the feature selection of a given font, two things need to be known: the currently selected features, and the currently selected font. Every time a font family is created, this information is saved inside a control sequence with the name of the font family itself.

This macro extracts this information, then appends the requested font features to add to the already existing ones, and calls the font again with the top level `\fontspec` command.

The default options are *not* applied (which is why `\g_fontspec_default_fontopts_tl` is emptied inside the group; this is allowed as `\l_fontsname_tl` is globally defined in `\@@_select_font_family:nn`), so this means that the only added features to the font are strictly those specified by this command.

`\addfontfeature` is defined as an alias, as I found that I often typed this instead when adding only a single font feature.

```

1 Programmer's interface

These functions are not used directly by fontspec when defining fonts; they are designed to be used by other packages who wish to do font-related things on top of fontspec itself.

Because I haven't fully explored how these functions will behave in practise, I am not giving them user-level names. As it becomes more clear which of these should be accessible by document writers, I'll open them up a little more.

All functions are defined assuming that the font to be queried is currently selected as a fontspec font. (I.e., via \fontspec or from a \newfontfamily macro or from \setmainfont and so on.)

\fontspec_if_fontspec_font:TF Test whether the currently selected font has been loaded by fontspec.

```
1 \prg_new_conditional:Nnn \fontspec_if_fontspec_font: {TF,T,F}
2 {
3     \cs_if_exist:cTF {g_@@_fontinfo_ \f@family _prop} \prg_return_true: \prg_return_false:
4 }
```

(End definition for \fontspec_if_fontspec_font:TF. This function is documented on page ??.)

\fontspec_if_aat_feature:nnTF Conditional to test if the currently selected font contains the AAT feature (#1,#2).

```
5 \prg_new_conditional:Nnn \fontspec_if_aat_feature:nn {TF,T,F}
6 {
7     \fontspec_if_fontspec_font:TF

20        \prg_return_false:
21    }
22 }
```

(End definition for \fontspec_if_aat_feature:nnTF. This function is documented on page ??.)

\fontspec_if_opentype:TF Test whether the currently selected font is an OpenType font. Always true for LuaTeX fonts.

```
23 \prg_new_conditional:Nnn \fontspec_if_opentype: {TF,T,F}
24 {

`\fontspec_set_family:Nnn` #1 : family
#2 : fontspec features
#3 : font name

Defines a new font family from given `<features>` and ``, and stores the name in the variable `<family>`. See the standard fontspec user commands for applications of this function.

We want to store the actual name of the font family within the `<family>` variable because the actual L^AT_EX family name is automatically generated by fontspec and it's easier to keep it that way.

fontspec-code-internal.dtx

1 Internals

1.1 The main function for setting fonts

\@@_select_font_family:nn This is the command that defines font families for use, the underlying procedure of all \fontspec-like commands. Given a list of font features (#1) for a requested font (#2), it will define an NFSS family for that font and put the family name (globally) into \l_fontspec_family_t1. The TeX '\font' command is (globally) stored in \l_fontspec_font.

This macro does its processing inside a group to attempt to restrict the scope of its internal processing. This works to some degree to insulate the internal commands from having to be manually cleared.

Some often-used variables to know about:

- \l_fontspec_fontname_t1 is used as the generic name of the font being defined.
- \l_@@_fontid_t1 is the unique identifier of the font with all its features.
- \l_@@_fontname_up_t1 is the font specifically to be used as the upright font.
- \l_@@_basename_t1 is the (immutable) original argument used for *-replacing.
- \l_fontspec_font is the plain TeX font of the upright font requested.

`\@@_preparse_features`: #1 : feature options
#2 : font name

Perform the (multi-step) feature parsing process.

Convert the requested features to font definition strings. First the features are parsed for information about font loading (whether it's a named font or external font, etc.), and then information is extracted for the names of the other shape fonts.

```

`\@@_get_features:Nn` This macro is a wrapper for `\keys_set:nn` which expands and adds a default specification to the original passed options. It begins by initialising the commands used to hold font-feature specific strings. Its argument is any additional features to prepend to the default.

1.2 Setting font shapes in a family

All NFSS specifications take their default values, so if any of them are redefined, the shapes will be selected to fit in with the current state. For example, if `\bfdefault` is redefined to `b`, all bold shapes defined by this package will also be assigned to `b`.

The combination shapes are searched first because they use information that may be redefined in the single cases. E.g., if no bold font is specified then `set_autofont` will attempt to set it. This has subtle/small ramifications on the logic of choosing the bold italic font.

If automatic, the `\l_fonts杵spec_renderer_tl` token list will still be empty (other suffices that could be added will be later in the feature processing), and if it is indeed still empty, assign it a value so that the other weights of the font are specifically loaded with the same renderer.

LuaTeX only supports one:

```
\@@_set_autofont:Nnn #1 : Font name tl
#2 : Base font name
#3 : Font name modifier
```

This function looks for font with `<name>` and `<modifier>` #2#3, and if found (i.e., different to font with name #2) stores it in tl #1. A modifier is something like /B to look for a bold font, for example.

We can't match external fonts in this way (in X_ET_EX anyway; todo: test with LuaTeX). If `` is not empty, then it's already been specified by the user so abort. If `<Base font name>` is not given, we also abort for obvious reasons.

If `` is empty, then proceed. If not found, `` remains empty. Otherwise, we have a match.

Wrapper for \DeclareFontShape. And finally the actual font shape declaration using \l_@@_nfss_tl defined above. \l_@@_postadjust_tl is defined in various places to deal with things like the hyphenation character and interword spacing.

The main part is to loop through SizeFeatures arguments, which are of the form

This extra stuff for the slanted shape substitution is a little bit awkward. We define the slanted shape to be a synonym for it when (a) we're defining an italic font, but also (b) when the default slanted shape isn't 'it'. (Presumably this turned up once in a test and I realised it caused problems. I doubt this would happen much.)

We should test when a slanted font has been specified and not run this code if so, but the @_set_slanted: code will overwrite this anyway if necessary.

```

This macro takes a four character string and converts it to the numerical representation required for X_ET_EX OpenType script/language/feature purposes. The output is stored in #1.

This code is not used in LuaT_EX, as the checking for that engine is done via Lua code provided by luatofload.

```
706 {*XE}
{ 707   \cs_new:Nn \@@_iv_str_to_num:Nn
 708   {
 709     \@@_strip_leading_sign:Nw #1#2 \q_nil
 710   }
 711   \cs_generate_variant:Nn \@@_iv_str_to_num:Nn {Nx}
```

The input can be of the form of any of these: 'abcd', 'abc', 'abc ', 'ab', 'ab ', etc. (It is assumed the first two chars are *always* not spaces.) So this macro reads in the string padded with \empty s, and anything beyond four chars is snipped. The \empty s then are used to reconstruct the spaces in the string to number calculation.

For backwards compatibility this code also strips a leading + or -.

```
712 \cs_set:Npn \@@_strip_leading_sign:Nw #1#2#3 \q_nil
713 {
714     \bool_if:nTF { \str_if_eq_p:nn {#2} {+} || \str_if_eq_p:nn {#2} {-} }
715     { \@@_iv_str_to_num:w #1 \q_nil #3 \c_empty_tl \c_empty_tl \q_nil }
716     { \@@_iv_str_to_num:w #1 \q_nil #2#3 \c_empty_tl \c_empty_tl \q_nil }
717 }
```

If input string (after sign is stripped) is more than 4 chars, #6 will contain '*(excess)*\c_empty_tl\c_empty_tl'. Therefore use #6 to verify string length.

```
718 \cs_set:Npn \@@_iv_str_to_num:w #1 \q_nil #2#3#4#5#6 \q_nil

1.1 Adding features when loading fonts

When remove clashing features,

1. remove the feature being added (to avoid duplicates);
2. remove the inverse of the feature (to avoid cancellation);
3. finally remove all clashing features.

\@@_make_AAT_feature_string:NnnTF This macro takes the numerical codes for a font feature and creates a specified macro containing the string required in the font definition to turn that feature on or off. Used primarily in [...], but also used to check if small caps exists in the requested font (see page 57).

For exclusive selectors, it's easy; just grab the string: For *non-exclusive* selectors, it's a little more complex. If the selector is even, it corresponds to switching the feature on. If the selector is *odd*, it corresponds to switching the feature off. But X_ET_EX doesn't return a selector string for this number, since the feature is defined for the 'switching on' value. So we need to

check the selector of the previous number, and then prefix the feature string with ! to denote the switch.

Finally, save out the complete feature string in \l_fontsfeature_string_tl.

1.4 General font-independent features

These features can be applied to any font.

NFSS encoding For the very brave.

```
238 \@@_keys_define_code:nnn {fontspec-preparse} {NFSSEncoding}
239 {
240     \tl_gset:Nx \g_@@_nfss_enc_tl { #1 }
241 }
```

NFSS family Interactions with other packages will sometimes require setting the NFSS family explicitly. (By default fontspec auto-generates one based on the font name.)

```
242 \@@_keys_define_code:nnn {fontspec-preparse} {NFSSFamily}
243 {
244     \tl_set:Nx \l_@@_nfss_fam_tl { #1 }

```

NFSS series/shape This option looks similar in name but has a very different function.

```
246 \@@_keys_define_code:nnn {fontspec} {FontFace}
247 {
248     \tl_clear:N \l_@@_this_font_tl

263     { \use_i:nnn #1 } { \use_i:nnn #1 } { \l_@@_this_font_tl } { \l_@@_this_feat_clist }
264 }
```

Scale If the input isn't one of the pre-defined string options, then it's gotta be numerical. `\fontspec_calc_scale:n` does all the work in the auto-scaling cases.

```
265 \@@_keys_define_code:nnn {fontspec} {Scale}
266 {
267     \str_case:nnF {#1}
268     {
269         {MatchLowercase} { \@@_calc_scale:n {5} }
270         {MatchUppercase} { \@@_calc_scale:n {8} }
271     }
272     { \tl_set:Nx \l_@@_scale_tl {#1} }
273     \tl_set:Nx \l_@@_scale_tl { s*[ \l_@@_scale_tl ] }
274 }
```

`\@@_calc_scale:n` This macro calculates the amount of scaling between the default roman font and the (default shape of) the font being selected such that the font dimension that is input is equal for both.

The only font dimensions that justify this are 5 (lowercase height) and 8 (uppercase height in X_ET_EX).

This script is executed for every extra shape, which seems wasteful, but allows alternate italic shapes from a separate font, say, to be loaded and to be auto-scaled correctly. Even if this would be ugly.

To begin, change to `\rmfamily` but use internal commands in case `csmfamily` has been overwritten. (Note that changing `\rmfamily` with `fontspec` resets `\encodingdefault` appropriately.)

```

275 \cs_new:Nn \@@_calc_scale:n

296 }
```

(End definition for `\@@_calc_scale:n`. This function is documented on page ??.)

`\@@_set_font_dimen:NnN` This function sets the dimension #1 (for font #3) to ‘fontdimen’ #2 for either font dimension 5 (x-height) or 8 (cap-height). If, for some reason, these return an incorrect ‘zero’ value (as `\fontdimen8` might for a .tfm font), then we cheat and measure the height of a glyph. We assume in this case that the font contains either an ‘X’ or an ‘x’.

```

297 \cs_new:Nn \@@_set_font_dimen:NnN

`_fontspec_parse_wordspace:w` This macro determines if the input to `WordSpace` is of the form `{X}` or `{X,Y,Z}` and executes the font scaling. If the former input, it executes `{X,X,X}`.

```

Hyphenation character This feature takes one of three arguments: ‘None’, *⟨glyph⟩*, or *⟨slot⟩*. If the input isn’t the first, and it’s one character, then it’s the second; otherwise, it’s the third.

(*LU)

These are to be given to a shape that has no real bold/italic to signal that fontspec should automatically create ‘fake’ shapes.

The behaviour is currently that only if both `AutoFakeSlant` and `AutoFakeBold` are specified, the bold italic is also faked.

These features presently *override* real shapes found in the font; in the future I’d like these features to be ignored in this case, instead. (This is just a bit harder to program in the current design of fontspec.)

fontspec-code-math.dtx

1 Selecting maths fonts

Here, the fonts used in math mode are redefined to correspond to the default roman, sans serif and typewriter fonts. Unfortunately, you can only define maths fonts in the preamble, otherwise I'd run this code whenever `\setmainfont` and friends was run.

`\fontspec_setup_maths:` Everything here is performed `\AtBeginDocument` in order to overwrite euler's attempt. This means fontspec must be loaded *after* euler. We set up a conditional to return an error if this rule is violated.

Since every maths setup is slightly different, we also take different paths for defining various math glyphs depending which maths font package has been loaded.

```
1  \@ifpackageloaded{euler}
2    { \bool_gset_true:N \g_@@_pkg_euler_loaded_bool }
3    { \bool_gset_false:N \g_@@_pkg_euler_loaded_bool }

4  \cs_new:Nn \fontspec_setup_maths:
5  {
6    \@ifpackageloaded{euler}
7    {
8      \bool_if:NTF \g_@@_pkg_euler_loaded_bool
9      { \bool_gset_true:N \g_@@_math_euler_bool }
10     { \@@_error:n {euler-too-late} }
11   }
12   {}
13   \@ifpackageloaded{lucbmath}{ \bool_gset_true:N \g_@@_math_lucida_bool }{}
14   \@ifpackageloaded{lucidabr}{ \bool_gset_true:N \g_@@_math_lucida_bool }{}
15   \@ifpackageloaded{lucimatx}{ \bool_gset_true:N \g_@@_math_lucida_bool }{}
```

Knuth's CM fonts fonts are all squashed together, combining letters, accents, text symbols and maths symbols all in the one font, `cmr`, plus other things in other fonts. Because we are changing the roman font in the document, we need to redefine all of the maths glyphs in L^AT_EX's operators maths font to still go back to the legacy `cmr` font for all these random glyphs, unless a separate maths font package has been loaded instead.

In every case, the maths accents are always taken from the `operators` font, which is generally the main text font. (Actually, there is a `\hat` accent in `EulerFractur`, but it's *ugly*. So I ignore it. Sorry if this causes inconvenience.)

```
16  \DeclareSymbolFont{legacymaths}{OT1}{cmr}{m}{n}
17  \SetSymbolFont{legacymaths}{bold}{OT1}{cmr}{bx}{n}
18  \DeclareMathAccent{\acute}{\mathalpha}{legacymaths}{19}
19  \DeclareMathAccent{\grave}{\mathalpha}{legacymaths}{18}
20  \DeclareMathAccent{\ddot}{\mathalpha}{legacymaths}{127}
21  \DeclareMathAccent{\tilde}{\mathalpha}{legacymaths}{126}
22  \DeclareMathAccent{\bar}{\mathalpha}{legacymaths}{22}
23  \DeclareMathAccent{\breve}{\mathalpha}{legacymaths}{21}
24  \DeclareMathAccent{\check}{\mathalpha}{legacymaths}{20}
25  \DeclareMathAccent{\hat}{\mathalpha}{legacymaths}{94} % too bad, euler
```

```

26 \DeclareMathAccent{\dot}{\mathalpha}{legacymaths}{95}
27 \DeclareMathAccent{\mathring}{\mathalpha}{legacymaths}{23}

```

\colon: what's going on? Okay, so : and \colon in maths mode are defined in a few places, so I need to work out what does what. Respectively, we have:

```

% % fontmath.ltx:
% \DeclareMathSymbol{\colon}{\mathpunct}{operators}{3A}
% \DeclareMathSymbol{:}{\mathrel}{operators}{3A}
%
% % amsmath.sty:
% \renewcommand{\colon}{\nobreak\mskip2mu\mathpunct{}\nonscript
%   \mkern-\thinmuskip:\mskip6mu plus1mu\relax}
%
% % euler.sty:
% \DeclareMathSymbol{:}{\mathrel}{EulerFraktur}{3A}
%
% % lucbmath.sty:
% \DeclareMathSymbol{@tempb}{\mathpunct}{operators}{58}
% \ifx\colon@tempb
%   \DeclareMathSymbol{\colon}{\mathpunct}{operators}{58}
% \fi
% \DeclareMathSymbol{:}{\mathrel}{operators}{58}

```

($3A_{16} = 58_{10}$) So I think, based on this summary, that it is fair to tell fontsop to 'replace' the operators font with legacymaths for this symbol, except when amsmath is loaded since we want to keep its definition.

```

28 \group_begin:
29   \mathchardef\@tempa="603A \relax
30   \ifx\colon\@tempa
31     \DeclareMathSymbol{\colon}{\mathpunct}{legacymaths}{58}
32   \fi
33 \group_end:

```

The following symbols are only defined specifically in euler, so skip them if that package is loaded.

```

34 \bool_if:NF \g_@@_math_euler_bool
35 {
36   \DeclareMathSymbol{!}{\mathclose}{legacymaths}{33}
37   \DeclareMathSymbol{:}{\mathrel}{legacymaths}{58}
38   \DeclareMathSymbol{;}{\mathpunct}{legacymaths}{59}
39   \DeclareMathSymbol{?}{\mathclose}{legacymaths}{63}

```

And these ones are defined both in euler and lucbmath, so we only need to run this code if no extra maths package has been loaded.

```

40 \bool_if:NF \g_@@_math_lucida_bool

Finally, we change the font definitions for `\mathrm` and so on. These are defined using the `\g_@@_mathrm_tl(...)` macros, which default to `\rmdefault` but may be specified with the `\setmathrm(...)` commands in the preamble.

Since L^AT_EX only generally defines one level of boldness, we omit `\mathbf` in the bold maths series. It can be specified as per usual with `\setboldmathrm`, which stores the appropriate family name in `\g_@@_bfmathrm_tl`.

`\fontspec_maybe_setup_maths`:

We're a little less sophisticated about not executing the maths setup if various other maths font packages are loaded. This list is based on the wonderful 'L^AT_EX Font Catalogue': <http://www.tug.dk/FontCatalogue/mathfonts.html>. I'm sure there are more I've missed. Do the T_EX Gyre fonts have maths support yet?

Untested: would `\unless\ifnum\Gamma=28672\relax\bool_set_false:N \g_@@_math_bool\fi` be a better test? This needs more cooperation with euler and lucida, I think.

1.1 Italic small caps and so on

- \sishape These commands for actually selecting italic small caps have been defined for many years;
\textsi I'm inclined to drop them. They're probably used very infrequently; I personally prefer just writing \textit{\textsc{...}} instead.

```
2  \providecommand*\itscdefault{\itdefault\scdefault}
3  \providecommand*\slscdefault{\sldefault\scdefault}
4  \DeclareRobustCommand{\sishape}

6      \not@math@\alphabet\sishape\relax
7      \fontshape{\itscdefault}\selectfont

9  \DeclareTextFontCommand{\textsi}{\sishape}
```

(End definition for \sishape and \textsi. These functions are documented on page ??.)

LaTeX's 'shape' font axis needs to be overloaded to support italic small caps and slanted small caps. These are the combinations to support:

```
10 \cs_new:Nn \@@_shape_merge:nn { c_@@_shape_#1_#2_tl }
11 \tl_const:cn { \@@_shape_merge:nn \itdefault \scdefault } {\itscdefault}
12 \tl_const:cn { \@@_shape_merge:nn \sldefault \scdefault } {\slscdefault}
13 \tl_const:cn { \@@_shape_merge:nn \scdefault \itdefault } {\itscdefault}
14 \tl_const:cn { \@@_shape_merge:nn \scdefault \sldefault } {\slscdefault}
15 \tl_const:cn { \@@_shape_merge:nn \slscdefault \itdefault } {\itscdefault}
16 \tl_const:cn { \@@_shape_merge:nn \itscdefault \sldefault } {\slscdefault}
17 \tl_const:cn { \@@_shape_merge:nn \itscdefault \updefault } {\scdefault}
18 \tl_const:cn { \@@_shape_merge:nn \slscdefault \updefault } {\scdefault}
```

- \fontspec_merge_shape:n These macros enable the overload on the \..shape commands. First, a shape 'new+current' (prefix) or 'current+new' (suffix) is tried. If not found, fall back on the 'new' shape.

```
19 \cs_new:Nn \fontspec_merge_shape:n
20 {
21     \@@_if_merge_shape:nTF {#1}
22     { \fontshape { \tl_use:c { \@@_shape_merge:nn { \f@shape } {#1} } } \selectfont }
23     { \fontshape {#1} \selectfont }
24 }
```

The following is rather specific; it only returns true if the merged shape exists, but more importantly also if the merged shape is defined for the current font.

```
25 \prg_new_conditional:Nnn \@@_if_merge_shape:n [TF]
26 {
27     \bool_lazy_and:nnTF
28     { \tl_if_exist_p:c { \@@_shape_merge:nn { \f@shape } {#1} } }
29 }
```

```

30     \cs_if_exist_p:c

32         \f@encoding/\f@family/\f@series/
33         \tl_use:c { \g_@@_shape_merge:nn {\f@shape} {#1} }
34     }
35 }

1.1 \-

```

1.2 Verbatims

Many thanks to Apostolos Syropoulos for discovering this problem and writing the redefinition of L^AT_EX's `verbatim` environment and `\verb*` command.

`\fontspec_visible_space`: Print U+2423: OPEN BOX, which is used to visibly display a space character.

```
14 \cs_new:Nn \fontspec_visible_space:
15 {
16     \@@_primitive_font_glyph_if_exist:NnTF \font {"2423}
17     { \char"2423\scan_stop: }
18     { \fontspec_visible_space_fallback: }
19 }
```

(End definition for \fontspec_visible_space:. This function is documented on page ??.)

`\fontspec_visible_space_fallback`: If the current font doesn't have U+2423: OPEN BOX, use Latin Modern Mono instead.

```
20 \cs_new:Nn \fontspec_visible_space_fallback:
21 {
22     {
23         \usefont{\g_fontspec_encoding_tl}{lmtt}{\f@series}{\f@shape}
24         \textvisibleSpace
25     }
26 }
```

(End definition for \fontspec_visible_space_fallback:. This function is documented on page ??.)

\fontspec_print_visible_spaces: Helper macro to turn spaces (~ 20) active and print visible space instead.

```
27 \group_begin:  
28 \char_set_catcode_active:n{"20} %  
29 \cs_gset:Npn\fontspec_print_visible_spaces:{%  
30 \char_set_catcode_active:n{"20} %  
31 \cs_set_eq:NN\fontspec_visible_space:%  
32 }%  
33 \group_end:
```

(End definition for \fontspec_print_visible_spaces:. This function is documented on page ??.)

\verb Redefine \verb to use \fontspec_print_visible_spaces:..

```
\verb*  
34 \def\verb  
35 {  
36     \relax\ifmmode\hbox{\else\leavevmode\kern-.1em}\fi  
37     \bgroup  
38         \verb@eol@error \let\do\@makeother \dospecials  
39         \verbatim@font\@noligs  
40         \@ifstar\@sverb\@verb  
41     }  
42 \def\@sverb{\fontspec_print_visible_spaces:\@sverb}
```

(End definition for \verb and \verb*. These functions are documented on page ??.)

It's better to put small things into \AtBeginDocument, so here we go:

```
43 \AtBeginDocument  
44 {  
45     \fontspec_patch_verbatim:  
46     \fontspec_patch_moreverb:  
47     \fontspec_patch_fancyvrb:  
48     \fontspec_patch_listings:  
49 }
```

\verbatim* With the verbatim package.

```
50 \cs_set:Npn \fontspec_patch_verbatim:  
51 {  
52     \@ifpackageloaded{verbatim}  
53     {  
54         \cs_set:cpx {verbatim*}  
55         {  
56             \group_begin: \overbatim \fontspec_print_visible_spaces: \verbatim@start  
57         }  
58     }  
59 }
```

This is for vanilla L^AT_EX.

```
59 {  
60     \cs_set:cpx {verbatim*}  
61     {  
62         \overbatim \fontspec_print_visible_spaces: \@sxverbatim  
63     }  
64 }  
65 }
```

`listingcont*` This is for `moreverb`. The main `listing*` environment inherits this definition.

```
66 \cs_set:Npn \fontspec_patch_moreverb:
67 {
68     \Ifpackageloaded{moreverb}
69     {
70         \cs_set:cpn {listingcont*}
71         {
72             \cs_set:Npn \verb@processline
73             {
74                 \the\listing@line \global\advance\listing@line1\relax
75                 \the\verb@line\par
76             }
77             \verb@verbatim \fontspec_print_visible_spaces: \verb@start
78         }
79     }
80 }
```

`listings` and `fancyvrb` make things nice and easy:

```
81 \cs_set:Npn \fontspec_patch_fancyvrb:
82 {
83     \Ifpackageloaded{fancyvrb}
84     {
85         \cs_set_eq:NN \FancyVerbSpace \fontspec_visible_space:
86     }
87 }
88 \cs_set:Npn \fontspec_patch_listings:
89 {
90     \Ifpackageloaded{listings}
91     {
92         \cs_set_eq:NN \l_st@visiblespace \fontspec_visible_space:
93     }
94 }
```

1.3 \oldstylenums

`\oldstylenums` This command obviously needs a redefinition. And we may as well provide the reverse command.

```
95 \RenewDocumentCommand \oldstylenums {m}
96 {
97     { \addfontfeature{Numbers=OldStyle} #1 }
98 }
99 \NewDocumentCommand \liningnums {m}
100 {
101     { \addfontfeature{Numbers=Lining} #1 }
102 }
```

(End definition for `\oldstylenums` and `\liningnums`. These functions are documented on page ??.)

```
103 </fontspec>
```
