

The lexikon package*

Axel Kielhorn

This is the `lexikon` package. When I posted it to `de.comp.text.tex` some weeks ago it's name was `dictionary.sty`. I changed it to fit into 8 characters.

This package provides some commands which may be useful for a two language dictionary with additional information for the keywords. There is only `lexikon.tex` as a documentation and it is in German but should be sufficient to line out the usage. If you need phonetic symbols you have to get the `ips.sty` and read the manual, I can't help you with that.

This package is unsupported, but if you have an idea for an enhancement or find a bug just send me a mail. I'll try to fix it but won't spend many hours on the package because it already does what I need.

A database interface would be nice but will take some time. My first idea was to use Bib_TE_X, but now I started using Perl. I'm not sure it will ever be ready.

*This manual corresponds to `lexikon v0.1c`, dated 1999/05/13.
