

The package `piton`*

F. Pantigny
fpantigny@wanadoo.fr

September 17, 2023

Abstract

The package `piton` provides tools to typeset computer listings in Python, OCaml, C and SQL with syntactic highlighting by using the Lua library LPEG. It requires LuaLaTeX.

1 Presentation

The package `piton` uses the Lua library LPEG¹ for parsing Python, OCaml, C or SQL listings and typesets them with syntactic highlighting. Since it uses Lua code, it works with `lualatex` only (and won't work with the other engines: `latex`, `pdflatex` and `xelatex`). It does not use external program and the compilation does not require `--shell-escape`. The compilation is very fast since all the parsing is done by the library LPEG, written in C.

Here is an example of code typeset by `piton`, with the environment `{Piton}`.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
        (we have used that arctan(x) + arctan(1/x) =  $\frac{\pi}{2}$  for  $x > 0$ )2
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
```

2 Installation

The package `piton` is contained in two files: `piton.sty` and `piton.lua` (the LaTeX file `piton.sty` loaded by `\usepackage` will load the Lua file `piton.lua`). Both files must be in a repertory where LaTeX will be able to find them, for instance in a `texmf` tree. However, the best is to install `piton` with a TeX distribution such as MiKTeX, TeX Live or MacTeX.

*This document corresponds to the version 2.2a of `piton`, at the date of 2023/09/17.

¹LPEG is a pattern-matching library for Lua, written in C, based on *parsing expression grammars*: <http://www.inf.puc-rio.br/~roberto/lpeg/>

²This LaTeX escape has been done by beginning the comment by `#>`.

3 Use of the package

3.1 Loading the package

The package `piton` should be loaded with the classical command `\usepackage{piton}`. Nevertheless, we have two remarks:

- the package `piton` uses the package `xcolor` (but `piton` does *not* load `xcolor`: if `xcolor` is not loaded before the `\begin{document}`, a fatal error will be raised).
- the package `piton` must be used with LuaLaTeX exclusively: if another LaTeX engine (`latex`, `pdflatex`, `xelatex`,...) is used, a fatal error will be raised.

3.2 Choice of the computer language

In current version, the package `piton` supports four computer languages: Python, OCaml, SQL and C (in fact C++).

By default, the language used is Python.

It's possible to change the current language with the command `\PitonOptions` and its key `language`: `\PitonOptions{language = C}`.

In what follows, we will speak of Python, but the features described also apply to the other languages.

3.3 The tools provided to the user

The package `piton` provides several tools to typeset Python code: the command `\piton`, the environment `{Piton}` and the command `\PitonInputFile`.

- The command `\piton` should be used to typeset small pieces of code inside a paragraph. For example:

```
\piton{def square(x): return x*x}      def square(x): return x*x
```

The syntax and particularities of the command `\piton` are detailed below.

- The environment `{Piton}` should be used to typeset multi-lines code. Since it takes its argument in a verbatim mode, it can't be used within the argument of a LaTeX command. For sake of customization, it's possible to define new environments similar to the environment `{Piton}` with the command `\NewPitonEnvironment`: cf. 4.3 p. 8.
- The command `\PitonInputFile` is used to insert and typeset a external file.

It's possible to insert only a part of the file: cf. part 5.2, p. 9.

New 2.2 The key `path` of the command `\PitonOptions` specifies a path where the files included by `\PitonInputFile` will be searched.

3.4 The syntax of the command `\piton`

In fact, the command `\piton` is provided with a double syntax. It may be used as a standard command of LaTeX taking its argument between curly braces (`\piton{...}`) but it may also be used with a syntax similar to the syntax of the command `\verb`, that is to say with the argument delimited by two identical characters (e.g.: `\piton|...|`).

- **Syntax `\piton{...}`**

When its argument is given between curly braces, the command `\piton` does not take its argument in verbatim mode. In particular:

- several consecutive spaces will be replaced by only one space (and the also the character of end on line),
but the command `_` is provided to force the insertion of a space;
- it's not possible to use `%` inside the argument,
but the command `\%` is provided to insert a %;

- the braces must be appear by pairs correctly nested
but the commands `\{` and `\}` are also provided for individual braces;
- the LaTeX commands³ are fully expanded and not executed,
so it's possible to use `\\` to insert a backslash.

The other characters (including `#`, `^`, `_`, `&`, `$` and `@`) must be inserted without backslash.

Examples :

<code>\piton{MyString = '\n'}</code>	<code>MyString = '\n'</code>
<code>\piton{def even(n): return n%2==0}</code>	<code>def even(n): return n%2==0</code>
<code>\piton{c="#" # an affectation }</code>	<code>c="#" # an affectation</code>
<code>\piton{c="#" \ \ \ # an affectation }</code>	<code>c="#" # an affectation</code>
<code>\piton{MyDict = {'a': 3, 'b': 4 }}</code>	<code>MyDict = {'a': 3, 'b': 4 }</code>

It's possible to use the command `\piton` in the arguments of a LaTeX command.⁴

- **Syntaxe `\piton|...|`**

When the argument of the command `\piton` is provided between two identical characters, that argument is taken in a *verbatim mode*. Therefore, with that syntax, the command `\piton` can't be used within the argument of another command.

Examples :

<code>\piton MyString = '\n' </code>	<code>MyString = '\n'</code>
<code>\piton!def even(n): return n%2==0!</code>	<code>def even(n): return n%2==0</code>
<code>\piton+c="#" # an affectation +</code>	<code>c="#" # an affectation</code>
<code>\piton?MyDict = {'a': 3, 'b': 4}? </code>	<code>MyDict = {'a': 3, 'b': 4}</code>

4 Customization

With regard to the font used by `piton` in its listings, it's only the current monospaced font. The package `piton` merely uses internally the standard LaTeX command `\texttt`.

4.1 The keys of the command `\PitonOptions`

The command `\PitonOptions` takes in as argument a comma-separated list of *key=value* pairs. The scope of the settings done by that command is the current TeX group.⁵

These keys may also be applied to an individual environment `{Piton}` (between square brackets).

- The key `language` specifies which computer language is considered (that key is case-insensitive). Four values are allowed : `Python`, `OCaml`, `C` and `SQL`. The initial value is `Python`.
- The key `path` specifies a path where the files included by `\PitonInputFile` will be searched.
- The key `gobble` takes in as value a positive integer *n*: the first *n* characters are discarded (before the process of highlightning of the code) for each line of the environment `{Piton}`. These characters are not necessarily spaces.
- When the key `auto-gobble` is in force, the extension `piton` computes the minimal value *n* of the number of consecutive spaces beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of *n*.

³That concerns the commands beginning with a backslash but also the active characters (with catcode equal to 13).

⁴For example, it's possible to use the command `\piton` in a footnote. Example : `s = 'A string'`.

⁵We remind that a LaTeX environment is, in particular, a TeX group.

- When the key `env-gobble` is in force, `piton` analyzes the last line of the environment `{Piton}`, that is to say the line which contains `\end{Piton}` and determines whether that line contains only spaces followed by the `\end{Piton}`. If we are in that situation, `piton` computes the number n of spaces on that line and applies `gobble` with that value of n . The name of that key comes from *environment gobble*: the effect of `gobble` is set by the position of the commands `\begin{Piton}` and `\end{Piton}` which delimit the current environment.
- The key `line-numbers` activates the line numbering. in the environments `{Piton}` and in the listings resulting from the use of `\PitonInputFile`.

New 2.1 In fact, the key `line-numbers` has several subkeys.

- With the key `line-numbers/skip-empty-lines`, the empty lines are considered as non existent for the line numbering (if the key `/absolute` is in force, the key `/skip-empty-lines` is no-op in `\PitonInputFile`). The initial value of that key is `true` (and not `false`).⁶
- With the key `line-numbers/label-empty-lines`, the labels (that is to say the numbers) of the empty lines are displayed. If the key `/skip-empty-line` is in force, the key `/label-empty-lines` is no-op. The initial value of that key is `true`.
- With the key `line-numbers/absolute`, in the listings generated in `\PitonInputFile`, the numbers of the lines displayed are *absolute* (that is to say: they are the numbers of the lines in the file). That key may be useful when `\PitonInputFile` is used to insert only a part of the file (cf. part 5.2, p. 9). The key `/absolute` is no-op in the environments `{Piton}`.
- The key `line-numbers/start` requires that the line numbering begins to the value of the key.
- With the key `line-numbers/resume`, the counter of lines is not set to zero at the beginning of each environment `{Piton}` or use of `\PitonInputFile` as it is otherwise. That allows a numbering of the lines across several environments.
- The key `line-numbers/sep` is the horizontal distance between the numbers of lines (inserted by `line-numbers`) and the beginning of the lines of code. The initial value is 0.7 em.

For convenience, a mechanism of factorisation of the prefix `line-numbers` is provided. That means that it is possible, for instance, to write:

```
\PitonOptions
{
  line-numbers =
  {
    skip-empty-lines = false ,
    label-empty-lines = false ,
    sep = 1 em
  }
}
```

- The key `left-margin` corresponds to a margin on the left. That key may be useful in conjunction with the key `line-numbers` if one does not want the numbers in an overlapping position on the left.

It's possible to use the key `left-margin` with the value `auto`. With that value, if the key `line-numbers` is in force, a margin will be automatically inserted to fit the numbers of lines. See an example part 6.1 on page 18.

- The key `background-color` sets the background color of the environments `{Piton}` and the listings produced by `\PitonInputFile` (it's possible to fix the width of that background with the key `width` described below).

⁶For the language Python, the empty lines in the docstrings are taken into account (by design).

The key `background-color` supports also as value a *list* of colors. In this case, the successive rows are colored by using the colors of the list in a cyclic way.

Example : `\PitonOptions{background-color = {gray!5,white}}`

The key `background-color` accepts a color defined «on the fly». For example, it's possible to write `background-color = [cmyk]{0.1,0.05,0,0}`.

- With the key `prompt-background-color`, `piton` adds a color background to the lines beginning with the prompt “>>>” (and its continuation “...”) characteristic of the Python consoles with REPL (*read-eval-print loop*).
- The key `width` will fix the width of the listing. That width applies to the colored backgrounds specified by `background-color` and `prompt-background-color` but also for the automatic breaking of the lines (when required by `break-lines`: cf. 5.1.2, p. 9).

That key may take in as value a numeric value but also the special value `min`. With that value, the width will be computed from the maximal width of the lines of code. Caution: the special value `min` requires two compilations with LuaLaTeX⁷.

For an example of use of `width=min`, see the section 6.2, p. 18.

- When the key `show-spaces-in-strings` is activated, the spaces in the short strings (that is to say those delimited by ' or ") are replaced by the character `□` (U+2423 : OPEN BOX). Of course, that character U+2423 must be present in the monospaced font which is used.⁸

Example : `my_string = 'Very□good□answer'`

With the key `show-spaces`, all the spaces are replaced by U+2423 (and no line break can occur on those “visible spaces”, even when the key `break-lines`⁹ is in force).

```
\begin{Piton}[language=C,line-numbers,auto-gobble,background-color = gray!15]
void bubbleSort(int arr[], int n) {
    int temp;
    int swapped;
    for (int i = 0; i < n-1; i++) {
        swapped = 0;
        for (int j = 0; j < n - i - 1; j++) {
            if (arr[j] > arr[j + 1]) {
                temp = arr[j];
                arr[j] = arr[j + 1];
                arr[j + 1] = temp;
                swapped = 1;
            }
        }
        if (!swapped) break;
    }
}
\end{Piton}
```

```
1 void bubbleSort(int arr[], int n) {
2     int temp;
3     int swapped;
4     for (int i = 0; i < n-1; i++) {
5         swapped = 0;
6         for (int j = 0; j < n - i - 1; j++) {
7             if (arr[j] > arr[j + 1]) {
8                 temp = arr[j];
```

⁷The maximal width is computed during the first compilation, written on the `aux` file and re-used during the second compilation. Several tools such as `latexmk` (used by Overleaf) do automatically a sufficient number of compilations.

⁸The package `piton` simply uses the current monospaced font. The best way to change that font is to use the command `\setmonofont` of the package `fontspec`.

⁹cf. 5.1.2 p. 9

```

9         arr[j] = arr[j + 1];
10        arr[j + 1] = temp;
11        swapped = 1;
12    }
13 }
14 if (!swapped) break;
15 }
16 }

```

The command `\PitonOptions` provides in fact several other keys which will be described further (see in particular the “Pages breaks and line breaks” p. 8).

4.2 The styles

4.2.1 Notion of style

The package `piton` provides the command `\SetPitonStyle` to customize the different styles used to format the syntactic elements of the Python listings. The customizations done by that command are limited to the current TeX group.¹⁰

The command `\SetPitonStyle` takes in as argument a comma-separated list of *key=value* pairs. The keys are names of styles and the value are LaTeX formatting instructions.

These LaTeX instructions must be formatting instructions such as `\color{...}`, `\bfseries`, `\slshape`, etc. (the commands of this kind are sometimes called *semi-global* commands). It’s also possible to put, *at the end of the list of instructions*, a LaTeX command taking exactly one argument.

Here an example which changes the style used to highlight, in the definition of a Python function, the name of the function which is defined. That code uses the command `\highLight` of `lua-ul` (that package requires also the package `luacolor`).

```
\SetPitonStyle{ Name.Function = \bfseries \highLight[red!50] }
```

In that example, `\highLight[red!50]` must be considered as the name of a LaTeX command which takes in exactly one argument, since, usually, it is used with `\highLight[red!50]{...}`.

With that setting, we will have : `def cube(x) : return x * x * x`

The different styles, and their use by `piton` in the different languages which it supports (Python, OCaml, C and SQL), are described in the part 7, starting at the page 22.

The command `\PitonStyle` takes in as argument the name of a style and allows to retrieve the value (as a list of LaTeX instructions) of that style.

For example, it’s possible to write `{\PitonStyle{Keyword}{function}}` and we will have the word `function` formatted as a keyword.

The syntax `{\PitonStyle{style}{...}}` is mandatory in order to be able to deal both with the semi-global commands and the commands with arguments which may be present in the definition of the style *style*.

¹⁰We remind that a LaTeX environment is, in particular, a TeX group.

4.2.2 Global styles and local styles

A style may be defined globally with the command `\SetPitonStyle`. That means that it will apply to all the informatic languages that use that style.

For example, with the command

```
\SetPitonStyle{Comment = \color{gray}}
```

all the comments will be composed in gray in all the listings, whatever informatic language they use (Python, C, OCaml, etc.).

New 2.2 But it's also possible to define a style locally for a given informatic language by providing the name of that language as optional argument (between square brackets) to the command `\SetPitonStyle`.¹¹

For example, with the command

```
\SetPitonStyle[SQL]{Keywords = \color[HTML]{006699} \bfseries \MakeUppercase}
```

the keywords in the SQL listings will be composed in capital letters, even if they appear in lower case in the LaTeX source (we recall that, in SQL, the keywords are case-insensitive).

As expected, if an informatic language uses a given style and if that style has no local definition for that language, the global version is used. That notion of “global style” has no link with the notion of global definition in TeX (the notion of *group* in TeX).

The package `piton` itself (that is to say the file `piton.sty`) defines all the styles globally.

4.2.3 The style `UserFunction`

The extension `piton` provides a special style called `UserFunction`. That style applies to the names of the functions previously defined by the user (for example, in Python, these names are those following the keyword `def` in a previous Python listing). The initial value of that style is empty, and, therefore, the names of the functions are formatted as standard text (in black). However, it's possible to change the value of that style, as any other style, with the command `\SetPitonStyle`.

In the following example, we fix as value for that style `UserFunction` the initial value of the style `Name.Function` (which applies to the name of the functions, *at the moment of their definition*).

```
\SetPitonStyle{UserFunction = \color[HTML]{CC00FF}}
```

```
def transpose(v,i,j):
    x = v[i]
    v[i] = v[j]
    v[j] = x

def passe(v):
    for i in range(0,len(v)-1):
        if v[i] > v[i+1]:
            transpose(v,i,i+1)
```

As one see, the name `transpose` has been highlighted because it's the name of a Python function previously defined by the user (hence the name `UserFunction` for that style).

Of course, the list of the names of Python functions previously defined is kept in the memory of LuaLaTeX (in a global way, that is to say independently of the TeX groups). The extension `piton` provides a command to clear that list : it's the command `\PitonClearUserFunctions`. When it is used without argument, that command is applied to all the informatic languages used by the user but it's also possible to use it with an optional argument (between square brackets) which is a list of informatic languages to which the command will be applied.¹²

¹¹We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

¹²We remind that, in `piton`, the name of the informatic languages are case-insensitive.

4.3 Creation of new environments

Since the environment `{Piton}` has to catch its body in a special way (more or less as verbatim text), it's not possible to construct new environments directly over the environment `{Piton}` with the classical commands `\newenvironment` (of standard LaTeX) or `\NewDocumentEnvironment` (of LaTeX3).

That's why `piton` provides a command `\NewPitonEnvironment`. That command takes in three mandatory arguments.

That command has the same syntax as the classical environment `\NewDocumentEnvironment`.

With the following instruction, a new environment `{Python}` will be constructed with the same behaviour as `{Piton}`:

```
\NewPitonEnvironment{Python}{0}{\PitonOptions{#1}}{}
```

If one wishes to format Python code in a box of `tcolorbox`, it's possible to define an environment `{Python}` with the following code (of course, the package `tcolorbox` must be loaded).

```
\NewPitonEnvironment{Python}{}
{\begin{tcolorbox}}
{\end{tcolorbox}}
```

With this new environment `{Python}`, it's possible to write:

```
\begin{Python}
def square(x):
    """Compute the square of a number"""
    return x*x
\end{Python}
```

```
def square(x):
    """Compute the square of a number"""
    return x*x
```

5 Advanced features

5.1 Page breaks and line breaks

5.1.1 Page breaks

By default, the listings produced by the environment `{Piton}` and the command `\PitonInputFile` are not breakable.

However, the command `\PitonOptions` provides the key `splittable` to allow such breaks.

- If the key `splittable` is used without any value, the listings are breakable everywhere.
- If the key `splittable` is used with a numeric value n (which must be a non-negative integer number), the listings are breakable but no break will occur within the first n lines and within the last n lines. Therefore, `splittable=1` is equivalent to `splittable`.

Even with a background color (set by the key `background-color`), the pages breaks are allowed, as soon as the key `splittable` is in force.¹³

¹³With the key `splittable`, the environments `{Piton}` are breakable, even within a (breakable) environment of `tcolorbox`. Remind that an environment of `tcolorbox` included in another environment of `tcolorbox` is *not* breakable, even when both environments use the key `breakable` of `tcolorbox`.

5.1.2 Line breaks

By default, the elements produced by `piton` can't be broken by an end of line. However, there are keys to allow such breaks (the possible breaking points are the spaces, even the spaces in the Python strings).

- With the key `break-lines-in-piton`, the line breaks are allowed in the command `\piton{...}` (but not in the command `\piton|...|`, that is to say the command `\piton` in verbatim mode).
- With the key `break-lines-in-Piton`, the line breaks are allowed in the environment `{Piton}` (hence the capital letter P in the name) and in the listings produced by `\PitonInputFile`.
- The key `break-lines` is a conjunction of the two previous keys.

The package `piton` provides also several keys to control the appearance on the line breaks allowed by `break-lines-in-Piton`.

- With the key `indent-broken-lines`, the indentation of a broken line is respected at carriage return.
- The key `end-of-broken-line` corresponds to the symbol placed at the end of a broken line. The initial value is: `\hspace*{0.5em}\textbackslash`.
- The key `continuation-symbol` corresponds to the symbol placed at each carriage return. The initial value is: `+;` (the command `\;` inserts a small horizontal space).
- The key `continuation-symbol-on-indentation` corresponds to the symbol placed at each carriage return, on the position of the indentation (only when the key `indent-broken-line` is in force). The initial value is: `$_hookrightarrow\;$`.

The following code has been composed with the following tuning:

```
\PitonOptions{width=12cm,break-lines,indent-broken-lines,background-color=gray!15}
```

```
+ def dict_of_list(l):
+     """Converts a list of subrs and descriptions of glyphs in \
+     ↪ a dictionary"""
+     our_dict = {}
+     for list_letter in l:
+         if (list_letter[0][0:3] == 'dup'): # if it's a subr
+             name = list_letter[0][4:-3]
+             print("We treat the subr of number " + name)
+         else:
+             name = list_letter[0][1:-3] # if it's a glyph
+             print("We treat the glyph of number " + name)
+             our_dict[name] = [treat_Postscript_line(k) for k in \
+             ↪ list_letter[1:-1]]
+     return dict
```

5.2 Insertion of a part of a file

The command `\PitonInputFile` inserts (with formatting) the content of a file. In fact, it's possible to insert only a *part* of that file. Two mechanisms are provided in this aim.

- It's possible to specify the part that we want to insert by the numbers of the lines (in the original file).
- **New 2.1** It's also possible to specify the part to insert with textual markers.

In both cases, if we want to number the lines with the numbers of the lines in the file, we have to use the key `line-numbers/absolute`.

5.2.1 With line numbers

The command `\PitonInputFile` supports the keys `first-line` and `last-line` in order to insert only the part of file between the corresponding lines. Not to be confused with the key `line-numbers/start` which fixes the first line number for the line numbering. In a sens, `line-numbers/start` deals with the output whereas `first-line` and `last-line` deal with the input.

5.2.2 With textual markers

New 2.1

In order to use that feature, we first have to specify the format of the markers (for the beginning and the end of the part to include) with the keys `marker-beginning` and `marker-end` (usually with the command `\PitonOptions`).

Let us take a practical example.

We assume that the file to include contains solutions to exercises of programming on the following model.

```
#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>
```

The markers of the beginning and the end are the strings `#[Exercise 1]` and `#<Exercise 1>`. The string “`Exercise 1`” will be called the *label* of the exercise (or of the part of the file to be included). In order to specify such markers in `piton`, we will use the keys `marker/beginning` and `marker/end` with the following instruction (the character `#` of the comments of Python must be inserted with the protected form `\#`).

```
\PitonOptions{ marker/beginning = \#[#1] , marker/end = \#<#1> }
```

As one can see, `marker/beginning` is an expression corresponding to the mathematical function which transforms the label (here `Exercise 1`) into the the beginning marker (in the example `#[Exercise 1]`). The string `#1` corresponds to the occurrences of the argument of that function, which the classical syntax in TeX. Idem for `marker/end`.

Now, you only have to use the key `range` of `\PitonInputFile` to insert a marked content of the file.

```
\PitonInputFile[range = Exercise 1]{file_name}
```

```
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
```

The key `marker/include-line` requires the insertion of the lines containing the markers.

```

\PytonInputFile[marker/include-lines,range = Exercise 1]{file_name}

#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>

```

In fact, there exist also the keys `begin-range` and `end-range` to insert several marked contents at the same time.

For example, in order to insert the solutions of the exercises 3 to 5, we will write (if the file has the correct structure!):

```

\PytonInputFile[begin-range = Exercise 3, end-range = Exercise 5]{file_name}

```

5.3 Highlighting some identifiers

It's possible to require a changement of formatting for some identifiers with the key `identifiers` of `\PytonOptions`.¹⁴

That key takes in as argument a value of the following format:

```
{ names = names, style = instructions }
```

- `names` is a (comma-separated) list of identifier names;
- `instructions` is a list of LaTeX instructions of the same type as `piton` “styles” previously presented (cf 4.2 p. 6).

Caution: Only the identifiers may be concerned by that key. The keywords and the built-in functions won't be affected, even if their name is in the list `names`.

```

\PytonOptions
{
    identifiers =
    {
        names = { l1 , l2 } ,
        style = \color{red}
    }
}

\begin{Piton}
def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
\end{Piton}

```

¹⁴This feature is not available for the language SQL because, in SQL, there is no identifiers : there are only names of fields and names of tables.

```
def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
```

By using the key `identifier`, it's possible to add other built-in functions (or other new keywords, etc.) that will be detected by `piton`.

```
\PitonOptions
{
    identifiers =
    {
        names = { cos, sin, tan, floor, ceil, trunc, pow, exp, ln, factorial } ,
        style = \PitonStyle{Name.Builtin}
    }
}

\begin{Piton}
from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
\end{Piton}

from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
```

5.4 Mechanisms to escape to LaTeX

The package `piton` provides several mechanisms for escaping to LaTeX:

- It's possible to compose comments entirely in LaTeX.
- It's possible to have the elements between `$` in the comments composed in LaTeX mathematical mode.
- It's also possible to insert LaTeX code almost everywhere in a Python listing.

One should also remark that, when the extension `piton` is used with the class `beamer`, `piton` detects in `{Piton}` many commands and environments of Beamer: cf. 5.5 p. 15.

5.4.1 The “LaTeX comments”

In this document, we call “LaTeX comments” the comments which begins by `#>`. The code following those characters, until the end of the line, will be composed as standard LaTeX code. There is two tools to customize those comments.

- It's possible to change the syntactic mark (which, by default, is `#>`). For this purpose, there is a key `comment-latex` available only in the preamble of the document, allows to choice the characters which, preceded by `#`, will be the syntactic marker.

For example, if the preamble contains the following instruction:

```
\PitonOptions{comment-latex = LaTeX}
```

the LaTeX comments will begin by `#LaTeX`.

If the key `comment-latex` is used with the empty value, all the Python comments (which begins by `#`) will, in fact, be “LaTeX comments”.

- It’s possible to change the formatting of the LaTeX comment itself by changing the `piton style Comment.LaTeX`.

For example, with `\SetPitonStyle{Comment.LaTeX = \normalfont\color{blue}}`, the LaTeX comments will be composed in blue.

If you want to have a character `#` at the beginning of the LaTeX comment in the PDF, you can use set `Comment.LaTeX` as follows:

```
\SetPitonStyle{Comment.LaTeX = \color{gray}\#\normalfont\space }
```

For other examples of customization of the LaTeX comments, see the part 6.2 p. 18

If the user has required line numbers (with the key `line-numbers`), it’s possible to refer to a number of line with the command `\label` used in a LaTeX comment.¹⁵

5.4.2 The key “math-comments”

It’s possible to request that, in the standard Python comments (that is to say those beginning by `#` and not `#>`), the elements between `$` be composed in LaTeX mathematical mode (the other elements of the comment being composed verbatim).

That feature is activated by the key `math-comments`, which is available only in the preamble of the document.

Here is a example, where we have assumed that the preamble of the document contains the instruction `\PitonOptions{math-comment}`:

```
\begin{Piton}
def square(x):
    return x*x # compute $x^2$
\end{Piton}
```

```
def square(x):
    return x*x # compute  $x^2$ 
```

5.4.3 The mechanism “escape”

It’s also possible to overwrite the Python listings to insert LaTeX code almost everywhere (but between lexical units, of course). By default, `piton` does not fix any delimiters for that kind of escape. In order to use this mechanism, it’s necessary to specify the delimiters which will delimit the escape (one for the beginning and one for the end) by using the keys `begin-escape` and `end-escape`, available only in the preamble of the document.

In the following example, we assume that the preamble of the document contains the following instruction:

```
\PitonOptions{begin-escape=!,end-escape=!}
```

In the following code, which is a recursive programming of the mathematical factorial, we decide to highlight in yellow the instruction which contains the recursive call. That example uses the command `\highlight` of `lua-ul` (that package requires itself the package `luacolor`).

¹⁵That feature is implemented by using a redefinition of the standard command `\label` in the environments `{Piton}`. Therefore, incompatibilities may occur with extensions which redefine (globally) that command `\label` (for example: `varioref`, `refcheck`, `showlabels`, etc.)

```

\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        !\highLight{!return n*fact(n-1)!}!
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)

```

In fact, in that case, it's probably easier to use the command `\@highLight` of `lua-ul`: that command sets a yellow background until the end of the current TeX group. Since the name of that command contains the character `@`, it's necessary to define a synonym without `@` in order to be able to use it directly in `{Piton}`.

```

\makeatletter
\let\Yellow\@highLight
\makeatother

\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        !\Yellow!return n*fact(n-1)
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)

```

Caution : The escape to LaTeX allowed by the `begin-escape` and `end-escape` is not active in the strings nor in the Python comments (however, it's possible to have a whole Python comment composed in LaTeX by beginning it with `#>`; such comments are merely called “LaTeX comments” in this document).

5.4.4 The mechanism “escape-math”

The mechanism “`escape-math`” is very similar to the mechanism “`escape`” since the only difference is that the elements sent to LaTeX are composed in the math mode of LaTeX.

This mechanism is activated with the keys `begin-escape-math` and `end-escape-math` (which are available only in the preamble of the document).

Despite the technical similarity, the use of the the mechanism “`escape-math`” is in fact rather different from that of the mechanism “`escape`”. Indeed, since the elements are composed in a mathematical mode of LaTeX, they are, in particular, composed within a TeX group and therefore, they can't be used to change the formatting of other lexical units.

In the langages where the character `$` does not play a important role, it's possible to activate that mechanism “`escape-math`” with the character `$`:

```

\PitonOptions{begin-escape-math=$,end-escape-math=$}

```

Remark that the character `$` must *not* be protected by a backslash.

However, it's probably more prudent to use `\(` et `\)`.

```
\PitonOptions{begin-escape-math=\(,end-escape-math=\)}
```

Here is an example of utilisation.

```
\begin{Piton}[line-numbers]
def arctan(x,n=10):
    if \(x < 0\) :
        return \(-\arctan(-x)\)
    elif \(x > 1\) :
        return \(\pi/2 - \arctan(1/x)\)
    else:
        s = \(\emptyset\)
        for \((k)\) in range(\(n\)): s += \(\smash{\frac{(-1)^k}{2k+1} x^{2k+1}}\)
        return s
\end{Piton}
```

```
1 def arctan(x,n=10):
2     if x < 0 :
3         return -arctan(-x)
4     elif x > 1 :
5         return pi/2 - arctan(1/x)
6     else:
7         s = 0
8         for k in range(n): s +=  $\frac{(-1)^k}{2k+1} x^{2k+1}$ 
9         return s
```

5.5 Behaviour in the class Beamer

First remark

Since the environment `{Piton}` catches its body with a verbatim mode, it's necessary to use the environments `{Piton}` within environments `{frame}` of Beamer protected by the key `fragile`, i.e. beginning with `\begin{frame}[fragile]`.¹⁶

When the package `piton` is used within the class `beamer`¹⁷, the behaviour of `piton` is slightly modified, as described now.

5.5.1 `{Piton}` et `\PitonInputFile` are “overlay-aware”

When `piton` is used in the class `beamer`, the environment `{Piton}` and the command `\PitonInputFile` accept the optional argument `<...>` of Beamer for the overlays which are involved.

For example, it's possible to write:

```
\begin{Piton}<2-5>
...
\end{Piton}
```

and

```
\PitonInputFile<2-5>{my_file.py}
```

¹⁶Remind that for an environment `{frame}` of Beamer using the key `fragile`, the instruction `\end{frame}` must be alone on a single line (except for any leading whitespace).

¹⁷The extension `piton` detects the class `beamer` and the package `beamerarticle` if it is loaded previously but, if needed, it's also possible to activate that mechanism with the key `beamer` provided by `piton` at load-time: `\usepackage[beamer]{piton}`

5.5.2 Commands of Beamer allowed in `{Piton}` and `\PitonInputFile`

When `piton` is used in the class `beamer`, the following commands of `beamer` (classified upon their number of arguments) are automatically detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`):

- no mandatory argument : `\pause`¹⁸ ;
- one mandatory argument : `\action`, `\alert`, `\invisible`, `\only`, `\uncover` and `\visible` ;
- two mandatory arguments : `\alt` ;
- three mandatory arguments : `\temporal`.

In the mandatory arguments of these commands, the braces must be balanced. However, the braces included in short strings¹⁹ of Python are not considered.

Regarding the functions `\alt` and `\temporal` there should be no carriage returns in the mandatory arguments of these functions.

Here is a complete example of file:

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def string_of_list(l):
    """Convert a list of numbers in string"""
    \only<2->{s = "{" + str(l[0])}
    \only<3->{for x in l[1:]: s = s + "," + str(x)}
    \only<4->{s = s + "}"}
    return s
\end{Piton}
\end{frame}
\end{document}
```

In the previous example, the braces in the Python strings "{" and "}" are correctly interpreted (without any escape character).

5.5.3 Environments of Beamer allowed in `{Piton}` and `\PitonInputFile`

When `piton` is used in the class `beamer`, the following environments of Beamer are directly detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`): `{actionenv}`, `{alertenv}`, `{invisibleenv}`, `{onlyenv}`, `{uncoverenv}` and `{visibleenv}`.

However, there is a restriction: these environments must contain only *whole lines of Python code* in their body.

Here is an example:

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def square(x):
    """Compute the square of its argument"""
    \begin{uncoverenv}<2>
```

¹⁸One should remark that it's also possible to use the command `\pause` in a "LaTeX comment", that is to say by writing `#> \pause`. By this way, if the Python code is copied, it's still executable by Python

¹⁹The short strings of Python are the strings delimited by characters `'` or the characters `"` and not `'''` nor `"""`. In Python, the short strings can't extend on several lines.

```

    return x*x
\end{uncoverenv}
\end{Piton}
\end{frame}
\end{document}

```

Remark concerning the command `\alert` and the environment `{alertenv}` of Beamer

Beamer provides an easy way to change the color used by the environment `{alertenv}` (and by the command `\alert` which relies upon it) to highlight its argument. Here is an example:

```
\setbeamercolor{alerted text}{fg=blue}
```

However, when used inside an environment `{Piton}`, such tuning will probably not be the best choice because `piton` will, by design, change (most of the time) the color the different elements of text. One may prefer an environment `{alertenv}` that will change the background color for the elements to be highlighted.

Here is a code that will do that job and add a yellow background. That code uses the command `\@highLight` of `lua-ul` (that extension requires also the package `luacolor`).

```

\setbeamercolor{alerted text}{bg=yellow!50}
\makeatletter
\AddToHook{env/Piton/begin}
  {\renewenvironment<>{alertenv}{\only#1{\@highLight[alerted text.bg]}}{}}
\makeatother

```

That code redefines locally the environment `{alertenv}` within the environments `{Piton}` (we recall that the command `\alert` relies upon that environment `{alertenv}`).

5.6 Footnotes in the environments of `piton`

If you want to put footnotes in an environment `{Piton}` or (or, more unlikely, in a listing produced by `\PitonInputFile`), you can use a pair `\footnotemark`–`\footnotetext`.

However, it's also possible to extract the footnotes with the help of the package `footnote` or the package `footnotehyper`.

If `piton` is loaded with the option `footnote` (with `\usepackage[footnote]{piton}` or with `\PassOptionsToPackage`), the package `footnote` is loaded (if it is not yet loaded) and it is used to extract the footnotes.

If `piton` is loaded with the option `footnotehyper`, the package `footnotehyper` is loaded (if it is not yet loaded) and it is used to extract footnotes.

Caution: The packages `footnote` and `footnotehyper` are incompatible. The package `footnotehyper` is the successor of the package `footnote` and should be used preferently. The package `footnote` has some drawbacks, in particular: it must be loaded after the package `xcolor` and it is not perfectly compatible with `hyperref`.

In this document, the package `piton` has been loaded with the option `footnotehyper`. For examples of notes, cf. [6.3](#), p. [19](#).

5.7 Tabulations

Even though it's recommended to indent the Python listings with spaces (see PEP 8), `piton` accepts the characters of tabulation (that is to say the characters U+0009) at the beginning of the lines. Each character U+0009 is replaced by n spaces. The initial value of n is 4 but it's possible to change it with the key `tab-size` of `\PitonOptions`.

There exists also a key `tabs-auto-gobble` which computes the minimal value n of the number of consecutive characters U+0009 beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of n (before replacement of the tabulations by spaces, of course). Hence, that key is similar to the key `auto-gobble` but acts on U+0009 instead of U+0020 (spaces).

6 Examples

6.1 Line numbering

We remind that it's possible to have an automatic numbering of the lines in the Python listings by using the key `line-numbers`.

By default, the numbers of the lines are composed by `piton` in an overlapping position on the left (by using internally the command `\llap` of LaTeX).

In order to avoid that overlapping, it's possible to use the option `left-margin=auto` which will insert automatically a margin adapted to the numbers of lines that will be written (that margin is larger when the numbers are greater than 10).

```
\PitonOptions{background-color=gray!10, left-margin = auto, line-numbers}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> (recursive call)
    elif x > 1:
        return pi/2 - arctan(1/x) #> (other recursive call)
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}
```

```
1 def arctan(x,n=10):
2     if x < 0:
3         return -arctan(-x)          (recursive call)
4     elif x > 1:
5         return pi/2 - arctan(1/x) (other recursive call)
6     else:
7         return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

6.2 Formatting of the LaTeX comments

It's possible to modify the style `Comment.LaTeX` (with `\SetPitonStyle`) in order to display the LaTeX comments (which begin with `#>`) aligned on the right margin.

```
\PitonOptions{background-color=gray!10}
\SetPitonStyle{Comment.LaTeX = \hfill \normalfont\color{gray}}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> other recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}
```

```
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)   another recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

It's also possible to display these LaTeX comments in a kind of second column by limiting the width of the Python code with the key `width`. In the following example, we use the key `width` with the special value `min`.

```

\PytonOptions{background-color=gray!10, width=min}
\NewDocumentCommand{\MyLaTeXCommand}{m}{\hfill \normalfont\itshape\rlap{\quad #1}}
\SetPytonStyle{Comment.LaTeX = \MyLaTeXCommand}
\begin{Pyton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x) #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
\end{Pyton}

```

```

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)
    elif x > 1:
        return pi/2 - arctan(1/x)
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s

```

recursive call

another recursive call

6.3 Notes in the listings

In order to be able to extract the notes (which are typeset with the command `\footnote`), the extension `piton` must be loaded with the key `footnote` or the key `footnotehyper` as explained in the section 5.6 p. 17. In this document, the extension `piton` has been loaded with the key `footnotehyper`. Of course, in an environment `{Pyton}`, a command `\footnote` may appear only within a LaTeX comment (which begins with `#>`). It's possible to have comments which contain only that command `\footnote`. That's the case in the following example.

```

\PytonOptions{background-color=gray!10}
\begin{Pyton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)#>\footnote{First recursive call.}]
    elif x > 1:
        return pi/2 - arctan(1/x)#>\footnote{Second recursive call.}]
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Pyton}

```

```

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)20
    elif x > 1:
        return pi/2 - arctan(1/x)21
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )

```

²⁰First recursive call.

²¹Second recursive call.

If an environment `{Piton}` is used in an environment `{minipage}` of LaTeX, the notes are composed, of course, at the foot of the environment `{minipage}`. Recall that such `{minipage}` can't be broken by a page break.

```
\PitonOptions{background-color=gray!10}
\emphase\begin{minipage}{\linewidth}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)#>\footnote{First recursive call.}
    elif x > 1:
        return pi/2 - arctan(1/x)#>\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}
\end{minipage}
```

```
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)a
    elif x > 1:
        return pi/2 - arctan(1/x)b
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

^aFirst recursive call.

^bSecond recursive call.

6.4 An example of tuning of the styles

The graphical styles have been presented in the section 4.2, p. 6.

We present now an example of tuning of these styles adapted to the documents in black and white. We use the font *Deja Vu Sans Mono*²² specified by the command `\setmonofont` of `fontspec`. That tuning uses the command `\highLight` of `lua-ul` (that package requires itself the package `luacolor`).

```
\setmonofont[Scale=0.85]{DejaVu Sans Mono}

\SetPitonStyle
{
    Number = ,
    String = \itshape ,
    String.Doc = \color{gray} \slshape ,
    Operator = ,
    Operator.Word = \bfseries ,
    Name.Builtin = ,
    Name.Function = \bfseries \highLight[gray!20] ,
    Comment = \color{gray} ,
    Comment.LaTeX = \normalfont \color{gray},
    Keyword = \bfseries ,
    Name.Namespace = ,
    Name.Class = ,
    Name.Type = ,
    InitialValues = \color{gray}
}
```

```
from math import pi
```

²²See: <https://dejavu-fonts.github.io>

```
def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
        (we have used that  $\arctan(x) + \arctan(1/x) = \pi/2$  for  $x > 0$ )
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
```

6.5 Use with pyluatex

The package pyluatex is an extension which allows the execution of some Python code from lualatex (provided that Python is installed on the machine and that the compilation is done with lualatex and --shell-escape).

Here is, for example, an environment `{PitonExecute}` which formats a Python listing (with `piton`) but display also the output of the execution of the code with Python (for technical reasons, the `!` is mandatory in the signature of the environment).

```
\ExplSyntaxOn
\NewDocumentEnvironment { PitonExecute } { ! O { } } % the ! is mandatory
{
    \PyLTVerbatimEnv
    \begin{pythonq}
}
{
    \end{pythonq}
    \directlua
    {
        tex.print("\PitonOptions{#1}")
        tex.print("\begin{Piton}")
        tex.print(pyluatex.get_last_code())
        tex.print("\end{Piton}")
        tex.print("")
    }
    \begin{center}
        \directlua{tex.print(pyluatex.get_last_output())}
    \end{center}
}
\ExplSyntaxOff
```

This environment `{PitonExecute}` takes in as optional argument (between square brackets) the options of the command `\PitonOptions`.

7 The styles for the different computer languages

7.1 The language Python

In `piton`, the default language is Python. If necessary, it's possible to come back to the language Python with `\PitonOptions{language=Python}`.

The initial settings done by `piton` in `piton.sty` are inspired by the style `manni` de Pygments, as applied by Pygments to the language Python.²³

Style	Use
Number	the numbers
String.Short	the short strings (entre ' ou ")
String.Long	the long strings (entre ' ' ou " ") excepted the doc-strings (governed by <code>String.Doc</code>)
String	that key fixes both <code>String.Short</code> et <code>String.Long</code>
String.Doc	the doc-strings (only with " " following PEP 257)
String.Interpol	the syntactic elements of the fields of the f-strings (that is to say the characters { et }); that style inherits for the styles <code>String.Short</code> and <code>String.Long</code> (according the kind of string where the interpolation appears)
Interpol.Inside	the content of the interpolations in the f-strings (that is to say the elements between { and }); if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
Operator	the following operators: != == << >> - ~ + / * % = < > & . @
Operator.Word	the following operators: <code>in</code> , <code>is</code> , <code>and</code> , <code>or</code> et <code>not</code>
Name.Builtin	almost all the functions predefined by Python
Name.Decorator	the decorators (instructions beginning by @)
Name.Namespace	the name of the modules
Name.Class	the name of the Python classes defined by the user <i>at their point of definition</i> (with the keyword <code>class</code>)
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword <code>def</code>)
UserFunction	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and, hence, these elements are drawn, by default, in the current color, usually black)
Exception	les exceptions prédéfinies (ex.: <code>SyntaxError</code>)
InitialValues	the initial values (and the preceding symbol =) of the optional arguments in the definitions of functions; if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
Comment	the comments beginning with #
Comment.LaTeX	the comments beginning with #>, which are composed by <code>piton</code> as LaTeX code (merely named "LaTeX comments" in this document)
Keyword.Constant	<code>True</code> , <code>False</code> et <code>None</code>
Keyword	the following keywords: <code>assert</code> , <code>break</code> , <code>case</code> , <code>continue</code> , <code>del</code> , <code>elif</code> , <code>else</code> , <code>except</code> , <code>exec</code> , <code>finally</code> , <code>for</code> , <code>from</code> , <code>global</code> , <code>if</code> , <code>import</code> , <code>lambda</code> , <code>non local</code> , <code>pass</code> , <code>raise</code> , <code>return</code> , <code>try</code> , <code>while</code> , <code>with</code> , <code>yield</code> et <code>yield from</code> .

²³See: <https://pygments.org/styles/>. Remark that, by default, Pygments provides for its style `manni` a colored background whose color is the HTML color `#F0F3F3`. It's possible to have the same color in `{Piton}` with the instruction `\PitonOptions{background-color = [HTML]{F0F3F3}}`.

7.2 The language OCaml

It's possible to switch to the language OCaml with `\PitonOptions{language = OCaml}`.

It's also possible to set the language OCaml for an individual environment `{Piton}`.

```
\begin{Piton}[language=OCaml]
...
\end{Piton}
```

The option exists also for `\PitonInputFile` : `\PitonInputFile[language=OCaml]{...}`

Style	Use
Number	the numbers
String.Short	the characters (between ')
String.Long	the strings, between " but also the <i>quoted-strings</i>
String	that key fixes both <code>String.Short</code> and <code>String.Long</code>
Operator	les opérateurs, en particulier +, -, /, *, @, !=, ==, &&
Operator.Word	les opérateurs suivants : <code>and</code> , <code>asr</code> , <code>land</code> , <code>lor</code> , <code>lsl</code> , <code>lxor</code> , <code>mod</code> et <code>or</code>
Name.Builtin	les fonctions <code>not</code> , <code>incr</code> , <code>decr</code> , <code>fst</code> et <code>snd</code>
Name.Type	the name of a type of OCaml
Name.Field	the name of a field of a module
Name.Constructor	the name of the constructors of types (which begins by a capital)
Name.Module	the name of the modules
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword <code>let</code>)
UserFunction	the name of the OCaml functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Exception	the predefined exceptions (eg : <code>End_of_File</code>)
TypeParameter	the parameters of the types
Comment	the comments, between (* et *); these comments may be nested
Keyword.Constant	<code>true</code> et <code>false</code>
Keyword	the following keywords: <code>assert</code> , <code>as</code> , <code>begin</code> , <code>class</code> , <code>constraint</code> , <code>done</code> , <code>downto</code> , <code>do</code> , <code>else</code> , <code>end</code> , <code>exception</code> , <code>external</code> , <code>for</code> , <code>function</code> , <code>functor</code> , <code>fun</code> , <code>if</code> , <code>include</code> , <code>inherit</code> , <code>initializer</code> , <code>in</code> , <code>lazy</code> , <code>let</code> , <code>match</code> , <code>method</code> , <code>module</code> , <code>mutable</code> , <code>new</code> , <code>object</code> , <code>of</code> , <code>open</code> , <code>private</code> , <code>raise</code> , <code>rec</code> , <code>sig</code> , <code>struct</code> , <code>then</code> , <code>to</code> , <code>try</code> , <code>type</code> , <code>value</code> , <code>val</code> , <code>virtual</code> , <code>when</code> , <code>while</code> and <code>with</code>

7.3 The language C (and C++)

It's possible to switch to the language C with `\PitonOptions{language = C}`.

It's also possible to set the language C for an individual environment `{Piton}`.

```
\begin{Piton}[language=C]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=C]{...}`

Style	Use
Number	the numbers
String.Long	the strings (between ")
String.Interpol	the elements %d, %i, %f, %c, etc. in the strings; that style inherits from the style String.Long
Operator	the following operators : != == << >> - ~ + / * % = < > & . @
Name.Type	the following predefined types: bool, char, char16_t, char32_t, double, float, int, int8_t, int16_t, int32_t, int64_t, long, short, signed, unsigned, void et wchar_t
Name.Builtin	the following predefined functions: printf, scanf, malloc, sizeof and alignof
Name.Class	le nom des classes au moment de leur définition, c'est-à-dire après le mot-clé class
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Preproc	the instructions of the preprocessor (beginning par #)
Comment	the comments (beginning by // or between /* and */)
Comment.LaTeX	the comments beginning by //> which are composed by piton as LaTeX code (merely named "LaTeX comments" in this document)
Keyword.Constant	default, false, NULL, nullptr and true
Keyword	the following keywords: alignas, asm, auto, break, case, catch, class, constexpr, const, continue, decltype, do, else, enum, extern, for, goto, if, noexcept, private, public, register, restricted, try, return, static, static_assert, struct, switch, thread_local, throw, typedef, union, using, virtual, volatile and while

7.4 The language SQL

It's possible to switch to the language SQL with `\PitonOptions{language = SQL}`.

It's also possible to set the language SQL for an individual environment `{Piton}`.

```
\begin{Piton}[language=SQL]
...
\end{Piton}
```

The option exists also for `\PitonInputFile` : `\PitonInputFile[language=SQL]{...}`

Style	Use
Number	the numbers
String.Long	the strings (between ' and not " because the elements between " are names of fields and formatted with <code>Name.Field</code>)
Operator	the following operators : = != <> >= > < <= * + /
Name.Table	the names of the tables
Name.Field	the names of the fields of the tables
Name.Builtin	the following built-in functions (their names are <i>not</i> case-sensitive): avg, count, char_lenght, concat, curdate, current_date, date_format, day, lower, ltrim, max, min, month, now, rank, round, rtrim, substring, sum, upper and year.
Comment	the comments (beginning by -- or between /* and */)
Comment.LaTeX	the comments beginning by --> which are composed by piton as LaTeX code (merely named "LaTeX comments" in this document)
Keyword	the following keywords (their names are <i>not</i> case-sensitive): add, after, all, alter, and, as, asc, between, by, change, column, create, cross join, delete, desc, distinct, drop, from, group, having, in, inner, insert, into, is, join, left, like, limit, merge, not, null, on, or, order, over, right, select, set, table, then, truncate, union, update, values, when, where and with.

8 Implementation

The development of the extension `piton` is done on the following GitHub depot:
<https://github.com/fpantigny/piton>

8.1 Introduction

The main job of the package `piton` is to take in as input a Python listing and to send back to LaTeX as output that code *with interlaced LaTeX instructions of formatting*.

In fact, all that job is done by a LPEG called `python`. That LPEG, when matched against the string of a Python listing, returns as capture a Lua table containing data to send to LaTeX. The only thing to do after will be to apply `tex.tprint` to each element of that table.²⁴

Consider, for example, the following Python code:

```
def parity(x):  
    return x%2
```

The capture returned by the lpeg `python` against that code is the Lua table containing the following elements :

```
{ "\\_\\_piton_begin_line:" }a  
{ "\\PitonStyle{Keyword}{ " }b  
{ luatexbase.catcodetables.CatcodeTableOtherc, "def" }  
{ "}}" }  
{ luatexbase.catcodetables.CatcodeTableOther, " " }  
{ "\\PitonStyle{Name.Function}{ " }  
{ luatexbase.catcodetables.CatcodeTableOther, "parity" }  
{ "}}" }  
{ luatexbase.catcodetables.CatcodeTableOther, "(" }  
{ luatexbase.catcodetables.CatcodeTableOther, "x" }  
{ luatexbase.catcodetables.CatcodeTableOther, ")" }  
{ luatexbase.catcodetables.CatcodeTableOther, ":" }  
{ "\\_\\_piton_end_line: \\_\\_piton_newline: \\_\\_piton_begin_line:" }  
{ luatexbase.catcodetables.CatcodeTableOther, " " }  
{ "\\PitonStyle{Keyword}{ " }  
{ luatexbase.catcodetables.CatcodeTableOther, "return" }  
{ "}}" }  
{ luatexbase.catcodetables.CatcodeTableOther, " " }  
{ luatexbase.catcodetables.CatcodeTableOther, "x" }  
{ "\\PitonStyle{Operator}{ " }  
{ luatexbase.catcodetables.CatcodeTableOther, "&" }  
{ "}}" }  
{ "\\PitonStyle{Number}{ " }  
{ luatexbase.catcodetables.CatcodeTableOther, "2" }  
{ "}}" }  
{ "\\_\\_piton_end_line:" }
```

^aEach line of the Python listings will be encapsulated in a pair: `__piton_begin_line: - __piton_end_line:`. The token `__piton_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `__piton_begin_line:`. Both tokens `__piton_begin_line:` and `__piton_end_line:` will be nullified in the command `\\piton` (since there can't be lines breaks in the argument of a command `\\piton`).

^bThe lexical elements of Python for which we have a `piton` style will be formatted via the use of the command `\\PitonStyle`. Such an element is typeset in LaTeX via the syntax `{\\PitonStyle{style}{...}}` because the instructions inside an `\\PitonStyle` may be both semi-global declarations like `\\bfseries` and commands with one argument like `\\fbox`.

^c`luatexbase.catcodetables.CatcodeTableOther` is a mere number which corresponds to the “catcode table” whose all characters have the catcode “other” (which means that they will be typeset by LaTeX verbatim).

²⁴Recall that `tex.tprint` takes in as argument a Lua table whose first component is a “catcode table” and the second element a string. The string will be sent to LaTeX with the regime of catcodes specified by the catcode table. If no catcode table is provided, the standard catcodes of LaTeX will be used.

We give now the LaTeX code which is sent back by Lua to TeX (we have written on several lines for legibility but no character `\r` will be sent to LaTeX). The characters which are greyed-out are sent to LaTeX with the catcode “other” (=12). All the others characters are sent with the regime of catcodes of L3 (as set by `\ExplSyntaxOn`)

```
\__piton_begin_line:{\PitonStyle{Keyword}{def}}
\__piton_end_line:\__piton_newline:
\__piton_begin_line:{\PitonStyle{Keyword}{return}}
\__piton_end_line:{\PitonStyle{Operator}{%}}{\PitonStyle{Number}{2}}\__piton_end_line:
```

8.2 The L3 part of the implementation

129 }

```

The flag `\g_@@_footnote_bool` is raised and so, we will only have to test `\g_@@_footnote_bool` in order to know if we have to insert an environment `{savenotes}`.

```

130 \lua_now:n { piton = piton~or { } }

```

8.2.2 Parameters and technical definitions

The following string will contain the name of the informatic language considered (the initial value is `python`).

```

131 \str_new:N \l_@@_language_str
132 \str_set:Nn \l_@@_language_str { python }

```

```
133 \tl_new:N \l_@@_path_tl
```

In order to have a better control over the keys.

```
134 \bool_new:N \l_@@_in_PitonOptions_bool
135 \bool_new:N \l_@@_in_PitonInputFile_bool
```

The following flag will be raised in the `\AtBeginDocument`.

```
136 \bool_new:N \g_@@_in_document_bool
```

We will compute (with Lua) the numbers of lines of the Python code and store it in the following counter.

```
137 \int_new:N \l_@@_nb_lines_int
```

The same for the number of non-empty lines of the Python codes.

```
138 \int_new:N \l_@@_nb_non_empty_lines_int
```

The following counter will be used to count the lines during the composition. It will count all the lines, empty or not empty. It won't be used to print the numbers of the lines.

```
139 \int_new:N \g_@@_line_int
```

The following token list will contain the (potential) informations to write on the aux (to be used in the next compilation).

```
140 \tl_new:N \g_@@_aux_tl
```

The following counter corresponds to the key `splittable` of `\PitonOptions`. If the value of `\l_@@_splittable_int` is equal to n , then no line break can occur within the first n lines or the last n lines of the listings.

```
141 \int_new:N \l_@@_splittable_int
```

An initial value of `splittable` equal to 100 is equivalent to say that the environments `{Piton}` are unbreakable.

```
142 \int_set:Nn \l_@@_splittable_int { 100 }
```

The following string corresponds to the key `background-color` of `\PitonOptions`.

```
143 \clist_new:N \l_@@_bg_color_clist
```

The package `piton` will also detect the lines of code which correspond to the user input in a Python console, that is to say the lines of code beginning with `>>>` and `....`. It's possible, with the key `prompt-background-color`, to require a background for these lines of code (and the other lines of code will have the standard background color specified by `background-color`).

```
144 \tl_new:N \l_@@_prompt_bg_color_tl
```

The following parameters correspond to the keys `begin-range` and `end-range` of the command `\PitonInputFile`.

```
145 \str_new:N \l_@@_begin_range_str
146 \str_new:N \l_@@_end_range_str
```

The argument of `\PitonInputFile`.

```
147 \tl_new:N \l_@@_file_name_tl
```

We will count the environments `{Piton}` (and, in fact, also the commands `\PitonInputFile`, despite the name `\g_@@_env_int`).

```
148 \int_new:N \g_@@_env_int
```

The following boolean corresponds to the key `show-spaces`.

```
149 \bool_new:N \l_@@_show_spaces_bool
```

The following booleans correspond to the keys `break-lines` and `indent-broken-lines`.

```
150 \bool_new:N \l_@@_break_lines_in_Piton_bool
151 \bool_new:N \l_@@_indent_broken_lines_bool
```

The following token list corresponds to the key `continuation-symbol`.

```

152 \tl_new:N \l_@@_continuation_symbol_tl
153 \tl_set:Nn \l_@@_continuation_symbol_tl { + }

154 % The following token list corresponds to the key
155 % |continuation-symbol-on-indentation|. The name has been shortened to |csoi|.
156 \tl_new:N \l_@@_csoi_tl
157 \tl_set:Nn \l_@@_csoi_tl { $ \hookrightarrow \; $ }
```

The following token list corresponds to the key `end-of-broken-line`.

```

158 \tl_new:N \l_@@_end_of_broken_line_tl
159 \tl_set:Nn \l_@@_end_of_broken_line_tl { \hspace*{0.5em} \textbackslash }
```

The following boolean corresponds to the key `break-lines-in-piton`.

```

160 \bool_new:N \l_@@_break_lines_in_piton_bool
```

The following dimension will be the width of the listing constructed by `{Piton}` or `\PitonInputFile`.

- If the user uses the key `width` of `\PitonOptions` with a numerical value, that value will be stored in `\l_@@_width_dim`.
- If the user uses the key `width` with the special value `min`, the dimension `\l_@@_width_dim` will, *in the second run*, be computed from the value of `\l_@@_line_width_dim` stored in the `aux` file (computed during the first run the maximal width of the lines of the listing). During the first run, `\l_@@_width_line_dim` will be set equal to `\linewidth`.
- Elsewhere, `\l_@@_width_dim` will be set at the beginning of the listing (in `\@@_pre_env:`) equal to the current value of `\linewidth`.

```

161 \dim_new:N \l_@@_width_dim
```

We will also use another dimension called `\l_@@_line_width_dim`. That will be the width of the actual lines of code. That dimension may be lower than the whole `\l_@@_width_dim` because we have to take into account the value of `\l_@@_left_margin_dim` (for the numbers of lines when `line-numbers` is in force) and another small margin when a background color is used (with the key `background-color`).

```

162 \dim_new:N \l_@@_line_width_dim
```

The following flag will be raised with the key `width` is used with the special value `min`.

```

163 \bool_new:N \l_@@_width_min_bool
```

If the key `width` is used with the special value `min`, we will compute the maximal width of the lines of an environment `{Piton}` in `\g_@@_tmp_width_dim` because we need it for the case of the key `width` is used with the special value `min`. We need a global variable because, when the key `footnote` is in force, each line when be composed in an environment `{savenotes}` and we need to exit our `\g_@@_tmp_width_dim` from that environment.

```

164 \dim_new:N \g_@@_tmp_width_dim
```

The following dimension corresponds to the key `left-margin` of `\PitonOptions`.

```

165 \dim_new:N \l_@@_left_margin_dim
```

The following boolean will be set when the key `left-margin=auto` is used.

```

166 \bool_new:N \l_@@_left_margin_auto_bool
```

The following dimension corresponds to the key `numbers-sep` of `\PitonOptions`.

```

167 \dim_new:N \l_@@_numbers_sep_dim
168 \dim_set:Nn \l_@@_numbers_sep_dim { 0.7 em }
```

The tabulators will be replaced by the content of the following token list.

```

169 \tl_new:N \l_@@_tab_tl
```

Be careful. The following sequence `\g_@@_languages_seq` is not the list of the languages supported by `piton`. It's the list of the languages for which at least a user function has been defined. We need that sequence only for the command `\PitonClearUserFunctions` when it is used without its optional argument: it must clear all the list of languages for which at least a user function has been defined.

```
170 \seq_new:N \g_@@_languages_seq

171 \cs_new_protected:Npn \@@_set_tab_tl:n #1
172 {
173   \tl_clear:N \l_@@_tab_tl
174   \prg_replicate:nn { #1 }
175   { \tl_put_right:Nn \l_@@_tab_tl { ~ } }
176 }
177 \@@_set_tab_tl:n { 4 }
```

The following integer corresponds to the key `gobble`.

```
178 \int_new:N \l_@@_gobble_int

179 \tl_new:N \l_@@_space_tl
180 \tl_set:Nn \l_@@_space_tl { ~ }
```

At each line, the following counter will count the spaces at the beginning.

```
181 \int_new:N \g_@@_indentation_int

182 \cs_new_protected:Npn \@@_an_indentation_space:
183 { \int_gincr:N \g_@@_indentation_int }
```

The following command `\@@_beamer_command:n` executes the argument corresponding to its argument but also stores it in `\l_@@_beamer_command_str`. That string is used only in the error message “`cr~not~allowed`” raised when there is a carriage return in the mandatory argument of that command.

```
184 \cs_new_protected:Npn \@@_beamer_command:n #1
185 {
186   \str_set:Nn \l_@@_beamer_command_str { #1 }
187   \use:c { #1 }
188 }
```

In the environment `{Piton}`, the command `\label` will be linked to the following command.

```
189 \cs_new_protected:Npn \@@_label:n #1
190 {
191   \bool_if:NTF \l_@@_line_numbers_bool
192   {
193     \bsphack
194     \protected@write \auxout { }
195     {
196       \string \newlabel { #1 }
197     }
198   }
```

Remember that the content of a line is typeset in a box *before* the composition of the potential number of line.

```
198       { \int_eval:n { \g_@@_visual_line_int + 1 } }
199       { \thepage }
200     }
201   }
202   \esphack
203 }
204 { \@@_error:n { label~with~lines~numbers } }
205 }
```

The following commands corresponds to the keys `marker/beginning` and `marker/end`. The values of that keys are functions that will be applied to the “*range*” specified by the final user in an individual `\PitonInputFile`. They will construct the markers used to find textually in the external file loaded by `piton` the part which must be included (and formatted).

```
206 \cs_new_protected:Npn \@@_marker_beginning:n #1 { }
207 \cs_new_protected:Npn \@@_marker_end:n #1 { }
```

The following commands are a easy way to insert safely braces (`{` and `}`) in the TeX flow.

```
208 \cs_new_protected:Npn \@@_open_brace: { \directlua { piton.open_brace() } }
209 \cs_new_protected:Npn \@@_close_brace: { \directlua { piton.close_brace() } }
```

The following token list will be evaluated at the beginning of `\@@_begin_line:...` `\@@_end_line:` and cleared at the end. It will be used by LPEG acting between the lines of the Python code in order to add instructions to be executed at the beginning of the line.

```
210 \tl_new:N \g_@@_begin_line_hook_tl
```

For example, the LPEG Prompt will trigger the following command which will insert an instruction in the hook `\g_@@_begin_line_hook` to specify that a background must be inserted to the current line of code.

```
211 \cs_new_protected:Npn \@@_prompt:
212 {
213   \tl_gset:Nn \g_@@_begin_line_hook_tl
214   {
215     \tl_if_empty:NF \l_@@_prompt_bg_color_tl % added 2023-04-24
216     { \clist_set:NV \l_@@_bg_color_clist \l_@@_prompt_bg_color_tl }
217   }
218 }
```

8.2.3 Treatment of a line of code

```
219 \cs_new_protected:Npn \@@_replace_spaces:n #1
220 {
221   \tl_set:Nn \l_tmpa_tl { #1 }
222   \bool_if:NTF \l_@@_show_spaces_bool
223   { \regex_replace_all:nnN { \x20 } { } \l_tmpa_tl } % U+2423
224 }
```

If the key `break-lines-in-Piton` is in force, we replace all the characters U+0020 (that is to say the spaces) by `\@@_breakable_space:.` Remark that, except the spaces inserted in the LaTeX comments (and maybe in the math comments), all these spaces are of catcode “other” (=12) and are unbreakable.

```
225   \bool_if:NT \l_@@_break_lines_in_Piton_bool
226   {
227     \regex_replace_all:nnN
228     { \x20 }
229     { \c { @@_breakable_space: } }
230     \l_tmpa_tl
231   }
232 }
233 \l_tmpa_tl
234 }
235 \cs_generate_variant:Nn \@@_replace_spaces:n { x }
```

In the contents provided by Lua, each line of the Python code will be surrounded by `\@@_begin_line:` and `\@@_end_line:`. `\@@_begin_line:` is a LaTeX command that we will define now but `\@@_end_line:` is only a syntactic marker that has no definition.

```
236 \cs_set_protected:Npn \@@_begin_line: #1 \@@_end_line:
237 {
238   \group_begin:
239   \g_@@_begin_line_hook_tl
```

```
240 \int_gzero:N \g_@@_indentation_int
```

First, we will put in the coffin `\l_tmpa_coffin` the actual content of a line of the code (without the potential number of line).

Be careful: There is currying in the following code.

```
241 \bool_if:NTF \l_@@_width_min_bool
242   \@@_put_in_coffin_ii:n
243   \@@_put_in_coffin_i:n
244   {
245     \language = -1
246     \raggedright
247     \strut
248     \@@_replace_spaces:n { #1 }
249     \strut \hfil
250   }
```

Now, we add the potential number of line, the potential left margin and the potential background.

```
251 \hbox_set:Nn \l_tmpa_box
252   {
253     \skip_horizontal:N \l_@@_left_margin_dim
254     \bool_if:NT \l_@@_line_numbers_bool
255     {
256       \bool_if:nF
257       {
258         \str_if_eq_p:nn { #1 } { \PitonStyle {Prompt}{ } }
259         &&
260         \l_@@_skip_empty_lines_bool
261       }
262       { \int_gincr:N \g_@@_visual_line_int}
263
264       \bool_if:nT
265       {
266         ! \str_if_eq_p:nn { #1 } { \PitonStyle {Prompt}{ } }
267         ||
268         ( ! \l_@@_skip_empty_lines_bool && \l_@@_label_empty_lines_bool )
269       }
270       \@@_print_number:
271
272     }
```

If there is a background, we must remind that there is a left margin of 0.5 em for the background...

```
273 \clist_if_empty:NF \l_@@_bg_color_clist
274   {
```

... but if only if the key left-margin is not used !

```
275     \dim_compare:nNnT \l_@@_left_margin_dim = \c_zero_dim
276       { \skip_horizontal:n { 0.5 em } }
277   }
278   \coffin_typeset:Nnnnn \l_tmpa_coffin T l \c_zero_dim \c_zero_dim
279 }
280 \box_set_dp:Nn \l_tmpa_box { \box_dp:N \l_tmpa_box + 1.25 pt }
281 \box_set_ht:Nn \l_tmpa_box { \box_ht:N \l_tmpa_box + 1.25 pt }
282 \clist_if_empty:NTF \l_@@_bg_color_clist
283   { \box_use_drop:N \l_tmpa_box }
284   {
285     \vtop
286     {
287       \hbox:n
288       {
289         \@@_color:N \l_@@_bg_color_clist
290         \vrule height \box_ht:N \l_tmpa_box
291           depth \box_dp:N \l_tmpa_box
292           width \l_@@_width_dim
293       }
294       \skip_vertical:n { - \box_ht_plus_dp:N \l_tmpa_box }
```

```

295         \box_use_drop:N \l_tmpa_box
296     }
297 }
298 \vspace { - 2.5 pt }
299 \group_end:
300 \tl_gclear:N \g_@@_begin_line_hook_tl
301 }

```

In the general case (which is also the simpler), the key `width` is not used, or (if used) it is not used with the special value `min`. In that case, the content of a line of code is composed in a vertical coffin with a width equal to `\l_@@_line_width_dim`. That coffin may, eventually, contains several lines when the key `broken-lines-in-Piton` (or `broken-lines`) is used.

That commands takes in its argument by curryfication.

```

302 \cs_set_protected:Npn \@@_put_in_coffin_i:n
303 { \vcoffin_set:Nnn \l_tmpa_coffin \l_@@_line_width_dim }

```

The second case is the case when the key `width` is used with the special value `min`.

```

304 \cs_set_protected:Npn \@@_put_in_coffin_ii:n #1
305 {

```

First, we compute the natural width of the line of code because we have to compute the natural width of the whole listing (and it will be written on the aux file in the variable `\l_@@_width_dim`).

```

306     \hbox_set:Nn \l_tmpa_box { #1 }

```

Now, you can actualize the value of `\g_@@_tmp_width_dim` (it will be used to write on the aux file the natural width of the environment).

```

307     \dim_compare:nNnT { \box_wd:N \l_tmpa_box } > \g_@@_tmp_width_dim
308     { \dim_gset:Nn \g_@@_tmp_width_dim { \box_wd:N \l_tmpa_box } }
309     \hcoffin_set:Nn \l_tmpa_coffin
310     {
311         \hbox_to_wd:nn \l_@@_line_width_dim

```

We unpack the block in order to free the potential `\hfill` springs present in the LaTeX comments (cf. section 6.2, p. 18).

```

312         { \hbox_unpack:N \l_tmpa_box \hfil }
313     }
314 }

```

The command `\@@_color:N` will take in as argument a reference to a comma-separated list of colors. A color will be picked by using the value of `\g_@@_line_int` (modulo the number of colors in the list).

```

315 \cs_set_protected:Npn \@@_color:N #1
316 {
317     \int_set:Nn \l_tmpa_int { \clist_count:N #1 }
318     \int_set:Nn \l_tmpb_int { \int_mod:nn \g_@@_line_int \l_tmpa_int + 1 }
319     \tl_set:Nx \l_tmpa_tl { \clist_item:Nn #1 \l_tmpb_int }
320     \tl_if_eq:NnTF \l_tmpa_tl { none }

```

By setting `\l_@@_width_dim` to zero, the colored rectangle will be drawn with zero width and, thus, it will be a mere strut (and we need that strut).

```

321     { \dim_zero:N \l_@@_width_dim }
322     { \exp_args:NV \@@_color_i:n \l_tmpa_tl }
323 }

```

The following command `\@@_color:n` will accept both the instruction `\@@_color:n { red!15 }` and the instruction `\@@_color:n { [rgb]{0.9,0.9,0} }`.

```

324 \cs_set_protected:Npn \@@_color_i:n #1

794 }
795 \cs_generate_variant:Nn \@@_compute_left_margin:nn { n V }

```

Whereas `\l_@@_with_dim` is the width of the environment, `\l_@@_line_width_dim` is the width of the lines of code without the potential margins for the numbers of lines and the background. Depending on the case, you have to compute `\l_@@_line_width_dim` from `\l_@@_width_dim` or we have to do the opposite.

```

796 \cs_new_protected:Npn \@@_compute_width:
797 {
798   \dim_compare:nNnTF \l_@@_line_width_dim = \c_zero_dim
799   {
800     \dim_set_eq:NN \l_@@_line_width_dim \l_@@_width_dim
801     \clist_if_empty:NTF \l_@@_bg_color_clist

```

If there is no background, we only subtract the left margin.

```

802     { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }

```

If there is a background, we subtract 0.5 em for the margin on the right.

```

803     {
804       \dim_sub:Nn \l_@@_line_width_dim { 0.5 em }

```

And we subtract also for the left margin. If the key `left-margin` has been used (with a numerical value or with the special value `min`), `\l_@@_left_margin_dim` has a non-zero value²⁵ and we use that value. Elsewhere, we use a value of 0.5 em.

```

805       \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
806       { \dim_sub:Nn \l_@@_line_width_dim { 0.5 em } }
807       { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
808     }
809   }

```

If `\l_@@_line_width_dim` has yet a non-empty value, that means that it has been read on the aux file: it has been written on a previous run because the key `width` is used with the special value `min`). We compute now the width of the environment by computations opposite to the preceding ones.

```

810   {

```

²⁵If the key `left-margin` has been used with the special value `min`, the actual value of `\l_@@_left_margin_dim` has yet been computed when we use the current command.

1118 {
1119   names .clist_set:N = \l_@@_identifiers_names_tl ,
1120   style .tl_set:N     = \l_@@_style_tl ,
1121 }
```

```
1122 \cs_new_protected:Npn \@@_set_identifiers:n #1
1123 {
1124   \clist_clear_new:N \l_@@_identifiers_names_tl
1125   \tl_clear_new:N \l_@@_style_tl
1126   \keys_set:nn { Piton / identifiers } { #1 }
1127   \clist_map_inline:Nn \l_@@_identifiers_names_tl
1128   {
1129     \tl_set_eq:cN
1130     { PitonIdentifier _ \l_@@_language_str _ ##1 }
1131     \l_@@_style_tl
1132   }
1133 }
```

In particular, we have an highlighting of the identifiers which are the names of Python functions previously defined by the user. Indeed, when a Python function is defined, the style `Name.Function.Internal` is applied to that name. We define now that style (you define it directly and you short-cut the function `\SetPitonStyle`).

```
1134 \cs_new_protected:cpn { pitonStyle _ Name.Function.Internal } #1
1135 {
```

First, the element is composed in the TeX flow with the style `Name.Function` which is provided to the final user.

```
1136   { \PitonStyle { Name.Function } { #1 } }
```

Now, we specify that the name of the new Python function is a known identifier that will be formatted with the Piton style `UserFunction`. Of course, here the affectation is global because we have to exit many groups and even the environments `{Piton}`.

```
1137   \cs_gset_protected:cpn { PitonIdentifier _ \l_@@_language_str _ #1 }
1138   { \PitonStyle { UserFunction } }
```

Now, we put the name of that new user function in the dedicated sequence (specific of the current language). **That sequence will be used only by `\PitonClearUserFunctions`.**

```
1139   \seq_if_exist:cF { g_@@_functions _ \l_@@_language_str _ seq }
1140   { \seq_new:c { g_@@_functions _ \l_@@_language_str _ seq } }
1141   \seq_gput_right:cn { g_@@_functions _ \l_@@_language_str _ seq } { #1 }
```

We update `\g_@@_languages_seq` which is used only by the command `\PitonClearUserFunctions` when it’s used without its optional argument.

```
1142   \seq_if_in:NVF \g_@@_languages_seq \l_@@_language_str
1143   { \seq_gput_left:NV \g_@@_languages_seq \l_@@_language_str }
1144 }
```

```

1145 \NewDocumentCommand \PitonClearUserFunctions { ! o }
1146 {
1147     \tl_if_novalue:nTF { #1 }

```

If the command is used without its optional argument, we will delete the user language for all the informatic languages.

```

1148     { \@@_clear_all_functions: }
1149     { \@@_clear_list_functions:n { #1 } }
1150 }

8.2.13 We load piton.lua

```

1318 \hook_gput_code:nnn { begindocument } { . }
1319 { \lua_now:e { require("piton.lua") } }
1320 </STY>

```

8.3 The Lua part of the implementation

The Lua code will be loaded via a `{luacode*}` environment. The environment is by itself a Lua block and the local declarations will be local to that block. All the global functions (used by the L3 parts of the implementation) will be put in a Lua table `piton`.

```

1321 <*LUA>
1322 if piton.comment_latex == nil then piton.comment_latex = ">" end
1323 piton.comment_latex = "#" .. piton.comment_latex

```

The following functions are an easy way to safely insert braces (`{` and `}`) in the TeX flow.

```

1324 function piton.open_brace ()
1325     tex.sprint("{")
1326 end
1327 function piton.close_brace ()
1328     tex.sprint("}")
1329 end

```

8.3.1 Special functions dealing with LPEG

We will use the Lua library `lpeg` which is built in LuaTeX. That's why we define first aliases for several functions of that library.

```

1330 local P, S, V, C, Ct, Cc = lpeg.P, lpeg.S, lpeg.V, lpeg.C, lpeg.Ct, lpeg.Cc
1331 local Cf, Cs, Cg, Cmt, Cb = lpeg.Cf, lpeg.Cs, lpeg.Cg, lpeg.Cmt, lpeg.Cb
1332 local R = lpeg.R

```

The function `Q` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with the catcode “other” for all the characters: it's suitable for elements of the Python listings that `piton` will typeset verbatim (thanks to the catcode “other”).

```

1333 local function Q(pattern)
1334     return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
1335 end

```

The function `L` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with standard LaTeX catcodes for all the characters: the elements captured will be formatted as normal LaTeX codes. It's suitable for the “LaTeX comments” in the environments `{Piton}` and the elements between `begin-escape` and `end-escape`. That function won't be much used.

```

1336 local function L(pattern)
1337     return Ct ( C ( pattern ) )
1338 end

```

The function `Lc` (the *c* is for *constant*) takes in as argument a string and returns a LPEG *with does a constant capture* which returns that string. The elements captured will be formatted as L3 code. It will be used to send to LaTeX all the formatting LaTeX instructions we have to insert in order to do the syntactic highlighting (that's the main job of `piton`). That function will be widely used.

```

1339 local function Lc(string)
1340   return Cc ( { luatexbase.catcodetables.expl , string } )
1341 end

```

The function `K` creates a LPEG which will return as capture the whole LaTeX code corresponding to a Python chunk (that is to say with the LaTeX formatting instructions corresponding to the syntactic nature of that Python chunk). The first argument is a Lua string corresponding to the name of a `piton` style and the second element is a pattern (that is to say a LPEG without capture)

```

1342 local function K(style, pattern)
1343   return
1344     Lc ( "{\\PitonStyle{" .. style .. "}{" )
1345     * Q ( pattern )
1346     * Lc ( "}" )
1347 end

```

The formatting commands in a given `piton` style (eg. the style `Keyword`) may be semi-global declarations (such as `\bfseries` or `\slshape`) or LaTeX macros with an argument (such as `\fbox` or `\colorbox{yellow}`). In order to deal with both syntaxes, we have used two pairs of braces: `{\\PitonStyle{Keyword}{text to format}}`.

The following function `WithStyle` is similar to the function `K` but should be used for multi-lines elements.

```

1348 local function WithStyle(style,pattern)
1349   return
1350     Ct ( Cc "Open" * Cc ( "{\\PitonStyle{" .. style .. "}{" ) * Cc "}" )
1351     * pattern
1352     * Ct ( Cc "Close" )
1353 end

```

The following LPEG catches the Python chunks which are in LaTeX escapes (and that chunks will be considered as normal LaTeX constructions). Since the elements that will be caught must be sent to LaTeX with standard LaTeX catcodes, we put the capture (done by the function `C`) in a table (by using `Ct`, which is an alias for `lpeg.Ct`) without number of catcode table at the first component of the table.

```

1354 Escape = P ( false )
1355 if piton.begin_escape ~= nil
1356 then
1357   Escape =
1358     P(piton.begin_escape)
1359     * L ( ( 1 - P(piton.end_escape) ) ^ 1 )
1360     * P(piton.end_escape)
1361 end
1362 EscapeMath = P ( false )
1363 if piton.begin_escape_math ~= nil
1364 then
1365   EscapeMath =
1366     P(piton.begin_escape_math)
1367     * Lc ( "\\ensuremath{" )
1368     * L ( ( 1 - P(piton.end_escape_math) ) ^ 1 )
1369     * Lc ( "}" )
1370     * P(piton.end_escape_math)
1371 end

```

The following line is mandatory.

```

1372 lpeg.locale(lpeg)

```

The basic syntactic LPEG

```
1373 local alpha, digit = lpeg.alpha, lpeg.digit
1374 local space = P " "
```

Remember that, for LPEG, the Unicode characters such as â, ã, ç, etc. are in fact strings of length 2 (2 bytes) because lpeg is not Unicode-aware.

```
1375 local letter = alpha + P "_"
1376   + P "â" + P "à" + P "ç" + P "é" + P "è" + P "ê" + P "ë" + P "ï" + P "î"
1377   + P "ô" + P "û" + P "ü" + P "Â" + P "Ã" + P "Ç" + P "É" + P "Ê" + P "Ë"
1378   + P "Ï" + P "Î" + P "Ï" + P "Ô" + P "Õ" + P "Ü"
1379
1380 local alphanum = letter + digit
```

The following LPEG `identifier` is a mere pattern (that is to say more or less a regular expression) which matches the Python identifiers (hence the name).

```
1381 local identifier = letter * alphanum ^ 0
```

On the other hand, the LPEG `Identifier` (with a capital) also returns a *capture*.

```
1382 local Identifier = K ( 'Identifier' , identifier )
```

By convention, we will use names with an initial capital for LPEG which return captures.

Here is the first use of our function `K`. That function will be used to construct LPEG which capture Python chunks for which we have a dedicated `piton` style. For example, for the numbers, `piton` provides a style which is called `Number`. The name of the style is provided as a Lua string in the second argument of the function `K`. By convention, we use single quotes for delimiting the Lua strings which are names of `piton` styles (but this is only a convention).

```
1383 local Number =
1384   K ( 'Number' ,
1385     ( digit^1 * P "." * digit^0 + digit^0 * P "." * digit^1 + digit^1 )
1386     * ( S "eE" * S "+-" ^ -1 * digit^1 ) ^ -1
1387     + digit^1
1388   )
```

We recall that `piton.begin_escape` and `piton.end_escape` are Lua strings corresponding to the keys `begin-escape` and `end-escape`.

```
1389 local Word
1390 if piton.begin_escape ~= nil -- before : ''
1391 then Word = Q ( ( ( 1 - space - P(piton.begin_escape) - P(piton.end_escape) )
1392   - S "'\"r[()]" - digit ) ^ 1 )
1393 else Word = Q ( ( ( 1 - space ) - S "'\"r[()]" - digit ) ^ 1 )
1394 end

1395 local Space = ( Q " " ) ^ 1
1396
1397 local SkipSpace = ( Q " " ) ^ 0
1398
1399 local Punct = Q ( S ".,:;!" )
1400
1401 local Tab = P "\t" * Lc ( '\\l_@@_tab_t1' )

1402 local SpaceIndentation = Lc ( '\\@@_an_indentation_space:' ) * ( Q " " )

1403 local Delim = Q ( S "[()]" )
```

The following LPEG catches a space (U+0020) and replace it by `\l_@@_space_t1`. It will be used in the strings. Usually, `\l_@@_space_t1` will contain a space and therefore there won't be difference. However, when the key `show-spaces-in-strings` is in force, `\l_@@_space_t1` will contain `□` (U+2423) in order to visualize the spaces.

```
1404 local VisualSpace = space * Lc "\\l_@@_space_t1"
```

If the classe Beamer is used, some environemnts and commands of Beamer are automatically detected in the listings of piton.

```
1405 local Beamer = P ( false )
1406 local BeamerBeginEnvironments = P ( true )
1407 local BeamerEndEnvironments = P ( true )
1408 if piton_beamer
1409 then
1410 % \bigskip
1411 % The following function will return a \textsc{lpeg} which will catch an
1412 % environment of Beamer (supported by \pkg{pion}), that is to say |\{uncover}|,
1413 % |\{only}|, etc.
1414 % \begin{macrocode}
1415 local BeamerNamesEnvironments =
1416   P "uncoverenv" + P "onlyenv" + P "visibleenv" + P "invisibleenv"
1417   + P "alertenv" + P "actionenv"
1418 BeamerBeginEnvironments =
1419   ( space ^ 0 *
1420     L
1421     (
1422       P "\\begin{" * BeamerNamesEnvironments * "}"
1423       * ( P "<" * ( 1 - P ">" ) ^ 0 * P ">" ) ^ -1
1424     )
1425     * P "\r"
1426   ) ^ 0
1427 BeamerEndEnvironments =
1428   ( space ^ 0 *
1429     L ( P "\\end{" * BeamerNamesEnvironments * P "}" )
1430     * P "\r"
1431   ) ^ 0
```

The following function will return a LPEG which will catch an environment of Beamer (supported by piton), that is to say {uncoverenv}, etc. The argument lpeg should be MainLoopPython, MainLoopC, etc.

```
1432 function OneBeamerEnvironment(name,lpeg)
1433   return
1434     Ct ( Cc "Open"
1435       * C (
1436         P ( "\\begin{" .. name .. "}" )
1437         * ( P "<" * ( 1 - P ">" ) ^ 0 * P ">" ) ^ -1
1438       )
1439       * Cc ( "\\end{" .. name .. "}" )
1440     )
1441   * (
1442     C ( ( 1 - P ( "\\end{" .. name .. "}" ) ) ^ 0 )
1443     / ( function (s) return lpeg : match(s) end )
1444   )

1505
1506
1507 local RaiseException = K ( 'Keyword' , P "raise" ) * SkipSpace * Exception * Q ( P "(" )
```

In Python, a “decorator” is a statement whose begins by `@` which patches the function defined in the following statement.

```
1509 local Decorator = K ( 'Name.Decorator' , P "@" * letter^1 )
```

The following LPEG `DefClass` will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style `Name.Class`).

Example: `class myclass:`

```
1510 local DefClass =
1511   K ( 'Keyword' , P "class" ) * Space * K ( 'Name.Class' , identifier )
```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG `Keyword` (useful if we want to type a list of keywords).

The following LPEG `ImportAs` is used for the lines beginning by `import`. We have to detect the potential keyword `as` because both the name of the module and its alias must be formatted with the piton style `Name.Namespace`.

Example: `import numpy as np`

Moreover, after the keyword `import`, it’s possible to have a comma-separated list of modules (if the keyword `as` is not used).

Example: `import math, numpy`

```
1512 local ImportAs =
1513   K ( 'Keyword' , P "import" )
1514   * Space
1515   * K ( 'Name.Namespace' ,
1516       identifier * ( P "." * identifier ) ^ 0 )
1517   * (
1518       ( Space * K ( 'Keyword' , P "as" ) * Space
1519         * K ( 'Name.Namespace' , identifier ) )
1520       +
1521       ( SkipSpace * Q ( P "," ) * SkipSpace
1522         * K ( 'Name.Namespace' , identifier ) ) ^ 0
1523   )
```

Be careful: there is no commutativity of `+` in the previous expression.

The LPEG `FromImport` is used for the lines beginning by `from`. We need a special treatment because the identifier following the keyword `from` must be formatted with the piton style `Name.Namespace` and the following keyword `import` must be formatted with the piton style `Keyword` and must *not* be caught by the LPEG `ImportAs`.

Example: `from math import pi`

```
1524 local FromImport =
1525   K ( 'Keyword' , P "from" )
1526   * Space * K ( 'Name.Namespace' , identifier )
1527   * Space * K ( 'Keyword' , P "import" )
```

The strings of Python For the strings in Python, there are four categories of delimiters (without counting the prefixes for f-strings and raw strings). We will use, in the names of our LPEG, prefixes to distinguish the LPEG dealing with that categories of strings, as presented in the following tabular.

	Single	Double
Short	'text'	"text"
Long	'''test'''	"""text"""

We have also to deal with the interpolations in the f-strings. Here is an example of a f-string with an interpolation and a format instruction²⁶ in that interpolation:

```
f'Total price: {total+1:.2f} €'
```

The interpolations beginning by % (even though there is more modern technics now in Python).

```
1528 local PercentInterpol =
1529   K ( 'String.Interpol' ,
1530       P "%"
1531       * ( P "(" * alphanum ^ 1 * P ")" ) ^ -1
1532       * ( S "-#0 +" ) ^ 0
1533       * ( digit ^ 1 + P "*" ) ^ -1
1534       * ( P "." * ( digit ^ 1 + P "*" ) ) ^ -1
1535       * ( S "HLL" ) ^ -1
1536       * S "sdfFeExXorgiGauc%"
1537   )
```

We can now define the LPEG for the four kinds of strings. It's not possible to use our function K because of the interpolations which must be formatted with another `piton` style that the rest of the string.²⁷

```
1538 local SingleShortString =
1539   WithStyle ( 'String.Short' ,
```

First, we deal with the f-strings of Python, which are prefixed by f or F.

```
1540   Q ( P "f'" + P "F'" )
1541   * (
1542       K ( 'String.Interpol' , P "{" )
1543       * K ( 'Interpol.Inside' , ( 1 - S "}':" ) ^ 0 )
1544       * Q ( P ":" * ( 1 - S "}':" ) ^ 0 ) ^ -1
1545       * K ( 'String.Interpol' , P "}" )
1546       +
1547       VisualSpace
1548       +
1549       Q ( ( P "\\'" + P "{{" + P "}" ) + 1 - S " {}'" ) ^ 1 )
1550   ) ^ 0
1551   * Q ( P "'" )
1552   +
```

Now, we deal with the standard strings of Python, but also the “raw strings”.

```
1553   Q ( P '"' + P "r'" + P "R'" )
1554   * ( Q ( ( P "\\'" + 1 - S " '\r%" ) ^ 1 )
1555       + VisualSpace
1556       + PercentInterpol
1557       + Q ( P "%" )
1558   ) ^ 0
1559   * Q ( P '"' ) )
1560
1561
1562 local DoubleShortString =
1563   WithStyle ( 'String.Short' ,
1564       Q ( P "f\\" + P "F\\" )
1565       * (
1566           K ( 'String.Interpol' , P "{" )
1567           * Q ( ( 1 - S "}\\':" ) ^ 0 , 'Interpol.Inside' )
1568           * ( K ( 'String.Interpol' , P ":" ) * Q ( ( 1 - S "}\\':" ) ^ 0 ) ) ^ -1
1569           * K ( 'String.Interpol' , P "}" )
1570       )
1571       +
1572       VisualSpace
```

²⁶There is no special `piton` style for the formatting instruction (after the colon): the style which will be applied will be the style of the encompassing string, that is to say `String.Short` or `String.Long`.

²⁷The interpolations are formatted with the `piton` style `Interpol.Inside`. The initial value of that style is `@@@_piton:n` wich means that the interpolations are parsed once again by `piton`.

```

1572         +
1573         Q ( ( P "\\\"" + P "{" + P "}" + 1 - S " {}\" " ) ^ 1 )
1574     ) ^ 0
1575 * Q ( P "\" )
1576 +
1577 Q ( P "\" + P "r\" + P "R\" )
1578 * ( Q ( ( P "\\\"" + 1 - S " \"r%" ) ^ 1 )
1579     + VisualSpace
1580     + PercentInterpol
1581     + Q ( P "%" )
1582 ) ^ 0
1583 * Q ( P "\" ) )
1584
1585 local ShortString = SingleShortString + DoubleShortString

```

Beamer The following pattern `balanced_braces` will be used for the (mandatory) argument of the commands `\only` and `al.` of Beamer. It's necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it's known in the theory of formal languages that this can't be done with regular expressions *stricto sensu* only).

```

1586 local balanced_braces =
1587   P { "E" ,
1588     E =
1589     (

1641     * K ( 'ParseAgain.noCR' , balanced_braces )
1642     * L ( P "}" )
1643 end

```

EOL The following LPEG will detect the Python prompts when the user is typesetting an interactive session of Python (directly or through `{pyconsole}` of `pyluatex`). We have to detect that prompt twice. The first detection (called *hasty detection*) will be before the `\\@_begin_line:` because you want to trigger a special background color for that row (and, after the `\\@_begin_line:`, it's too late to change de background).

```

1644 local PromptHastyDetection = ( # ( P ">>>" + P "..." ) * Lc ( '\\@_prompt:' ) ) ^ -1

```

We remind that the marker `#` of LPEG specifies that the pattern will be detected but won't consume any character.

With the following LPEG, a style will actually be applied to the prompt (for instance, it's possible to decide to discard these prompts).

```

1645 local Prompt = K ( 'Prompt' , ( ( P ">>>" + P "..." ) * P " " ^ -1 ) ^ -1 )

```

The following LPEG EOL is for the end of lines.

```

1646 local EOL =
1647     P "\r"
1648     *
1649     (
1650         ( space^0 * -1 )
1651     +

```

We recall that each line in the Python code we have to parse will be sent back to LaTeX between a pair `\\@_begin_line: - \\@_end_line:`²⁸.

```

1652     Ct (
1653         Cc "EOL"
1654         *
1655         Ct (
1656             Lc "\\@_end_line:"
1657             * BeamerEndEnvironments
1658             * BeamerBeginEnvironments
1659             * PromptHastyDetection
1660             * Lc "\\@_newline: \\@_begin_line:"
1661             * Prompt
1662         )

```

²⁸Remember that the `\\@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\\@_begin_line:`

```

1663     )
1664 )
1665 *
1666 SpaceIndentation ^ 0

```

The long strings

```

1667 local SingleLongString =
1668   WithStyle ( 'String.Long' ,
1669     ( Q ( S "fF" * P "'''" )
1670       * (
1671         K ( 'String.Interpol' , P "{" )
1672         * K ( 'Interpol.Inside' , ( 1 - S "}:\" - P "'''" ) ^ 0 )

1714       PercentInterpol
1715       +
1716       P "%"
1717       +
1718       EOL
1719     ) ^ 0
1720   )
1721   * Q ( P "\"\"\"" )
1722 )

```

```
1723 local LongString = SingleLongString + DoubleLongString
```

We have a LPEG for the Python docstrings. That LPEG will be used in the LPEG `DefFunction` which deals with the whole preamble of a function definition (which begins with `def`).

```
1724 local StringDoc =
1725     K ( 'String.Doc' , P "\"\\\"\"" )
1726     * ( K ( 'String.Doc' , ( 1 - P "\"\\\"\"" - P "\\r" ) ^ 0 ) * EOL
1727         * Tab ^ 0
1728         ) ^ 0
1729     * K ( 'String.Doc' , ( 1 - P "\"\\\"\"" - P "\\r" ) ^ 0 * P "\"\\\"\"" )
```

The comments in the Python listings We define different LPEG dealing with comments in the Python listings.

```
1730 local CommentMath =
1731     P "$" * K ( 'Comment.Math' , ( 1 - S "$\\r" ) ^ 1 ) * P "$"
1732
1733 local Comment =
1734     WithStyle ( 'Comment' ,
1735         Q ( P "#" )
1736         * ( CommentMath + Q ( ( 1 - S "$\\r" ) ^ 1 ) ) ^ 0 )
1737     * ( EOL + -1 )
```

The following LPEG `CommentLaTeX` is for what is called in that document the “LaTeX comments”. Since the elements that will be caught must be sent to LaTeX with standard LaTeX catcodes, we put the capture (done by the function `C`) in a table (by using `Ct`, which is an alias for `lpeg.Ct`).

```
1738 local CommentLaTeX =
1739     P(piton.comment_latex)
1740     * Lc "{\\PitonStyle{Comment.LaTeX}{\\ignorespaces}"
1741     * L ( ( 1 - P "\\r" ) ^ 0 )
1742     * Lc "}"
1743     * ( EOL + -1 )
```

DefFunction The following LPEG `expression` will be used for the parameters in the *argspec* of a Python function. It’s necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it’s known in the theory of formal languages that this can’t be done with regular expressions *stricto sensu* only).

```
1744 local expression =
1745     P { "E" ,
1746         E = ( P "'" * ( P "\\'" + 1 - S "\\r" ) ^ 0 * P "'"
1747             + P "\"" * ( P "\\\"" + 1 - S "\\r" ) ^ 0 * P "\""
1748             + P "{" * V "F" * P "}"
1749             + P "(" * V "F" * P ")"
1750             + P "[" * V "F" * P "]"
1751             + ( 1 - S "{}()[]\\r," ) ) ^ 0 ,
1752         F = ( P "{" * V "F" * P "}"
1753             + P "(" * V "F" * P ")"
1754             + P "[" * V "F" * P "]"
1755             + ( 1 - S "{}()[]\\r\\'" ) ) ^ 0
1756     }
```

We will now define a LPEG `Params` that will catch the list of parameters (that is to say the *argspec*) in the definition of a Python function. For example, in the line of code

```
def MyFunction(a,b,x=10,n:int): return n
```

the LPEG Params will be used to catch the chunk `a,b,x=10,n:int`.

Or course, a Params is simply a comma-separated list of Param, and that's why we define first the LPEG Param.

```

1757 local Param =
1758   SkipSpace * Identifier * SkipSpace
1759   * (
1760     K ( 'InitialValues' , P "=" * expression )
1761     + Q ( P ":" ) * SkipSpace * K ( 'Name.Type' , letter ^ 1 )
1762   ) ^ -1

1763 local Params = ( Param * ( Q "," * Param ) ^ 0 ) ^ -1

```

The following LPEG DefFunction catches a keyword `def` and the following name of function *but also everything else until a potential docstring*. That's why this definition of LPEG must occur (in the file `piton.sty`) after the definition of several other LPEG such as `Comment`, `CommentLaTeX`, `Params`, `StringDoc`...

```

1764 local DefFunction =
1765   K ( 'Keyword' , P "def" )
1766   * Space
1767   * K ( 'Name.Function.Internal' , identifier )
1768   * SkipSpace
1769   * Q ( P "(" ) * Params * Q ( P ")" )
1770   * SkipSpace
1771   * ( Q ( P "->" ) * SkipSpace * K ( 'Name.Type' , identifier ) ) ^ -1

```

Here, we need a piton style `ParseAgain` which will be linked to `\@@_piton:n` (that means that the capture will be parsed once again by piton). We could avoid that kind of trick by using a non-terminal of a grammar but we have probably here a better legibility.

```

1772 * K ( 'ParseAgain' , ( 1 - S ":\r" ) ^ 0 )
1773 * Q ( P ":" )
1774 * ( SkipSpace
1775   * ( EOL + CommentLaTeX + Comment ) -- in all cases, that contains an EOL
1776   * Tab ^ 0
1777   * SkipSpace
1778   * StringDoc ^ 0 -- there may be additionnal docstrings
1779 ) ^ -1

```

Remark that, in the previous code, `CommentLaTeX` *must* appear before `Comment`: there is no commutativity of the addition for the *parsing expression grammars* (PEG).

If the word `def` is not followed by an identifier and parenthesis, it will be caught as keyword by the LPEG Keyword (useful if, for example, the final user wants to speak of the keyword `def`).

Miscellaneous

```

1780 local ExceptionInConsole = Exception * Q ( ( 1 - P "\r" ) ^ 0 ) * EOL

```

The main LPEG for the language Python First, the main loop :

```

1781 local MainPython =
1782   EOL
1783   + Space
1784   + Tab
1785   + Escape + EscapeMath
1786   + CommentLaTeX
1787   + Beamer
1788   + LongString
1789   + Comment
1790   + ExceptionInConsole
1791   + Delim
1792   + Operator
1793   + OperatorWord * ( Space + Punct + Delim + EOL + -1 )

```

```

1794     + ShortString
1795     + Punct
1796     + FromImport
1797     + RaiseException
1798     + DefFunction
1799     + DefClass
1800     + Keyword * ( Space + Punct + Delim + EOL + -1 )
1801     + Decorator
1802     + Builtin * ( Space + Punct + Delim + EOL + -1 )
1803     + Identifier
1804     + Number
1805     + Word

```

Here, we must not put local!

```

1806 MainLoopPython =
1807   ( ( space1 * -1 )
1808     + MainPython
1809   ) 0

```

We recall that each line in the Python code to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`²⁹.

```

1810 local python = P ( true )
1811
1812 python =
1813   Ct (
1814     ( ( space - P "\r" ) 0 * P "\r" ) -1
1815     * BeamerBeginEnvironments

1991 )
1992 )
1993 )
1994 *
1995 SpaceIndentation ^ 0

```

The strings en OCaml We need a pattern `ocaml_string` without captures because it will be used within the comments of OCaml.

```

1996 local ocaml_string =
1997 Q ( P "\"" )
1998 * (
1999 VisualSpace
2000 +
2001 Q ( ( 1 - S " \r" ) ^ 1 )

```

```

2002         +
2003         EOL
2004     ) ^ 0
2005     * Q ( P "\"" )
2006 local String = WithStyle ( 'String.Long' , ocaml_string )

```

Now, the “quoted strings” of OCaml (for example {ext|Essai|ext}).

For those strings, we will do two consecutive analysis. First an analysis to determine the whole string and, then, an analysis for the potential visual spaces and the EOL in the string.

The first analysis require a match-time capture. For explanations about that programmation, see the paragraphe *Lua’s long strings* in www.inf.puc-rio.br/~roberto/lpeg.

```

2007 local ext = ( R "az" + P "_" ) ^ 0
2008 local open = "{" * Cg(ext, 'init') * "|"
2009 local close = "|" * C(ext) * "}"
2010 local closeeq =
2011     Cmt ( close * Cb('init'),
2012         function (s, i, a, b) return a==b end )

```

The LPEG QuotedStringBis will do the second analysis.

```

2013 local QuotedStringBis =
2014     WithStyle ( 'String.Long' ,
2015     (
2016         VisualSpace
2017         +
2018         Q ( ( 1 - S " \r" ) ^ 1 )
2019         +
2020         EOL
2021     ) ^ 0 )
2022

```

We use a “function capture” (as called in the official documentation of the LPEG) in order to do the second analysis on the result of the first one.

```

2023 local QuotedString =
2024     C ( open * ( 1 - closeeq ) ^ 0 * close ) /
2025     ( function (s) return QuotedStringBis : match(s) end )

```

The comments in the OCaml listings In OCaml, the delimiters for the comments are (* and *). There are unsymmetrical and OCaml allow those comments to be nested. That’s why we need a grammar.

In these comments, we embed the math comments (between \$ and \$) and we embed also a treatment for the end of lines (since the comments may be multi-lines).

```

2026 local Comment =
2027     WithStyle ( 'Comment' ,
2028     P {
2029         "A" ,
2030         A = Q "(*"
2031             * ( V "A"
2032                 + Q ( ( 1 - P "(*" - P *)" ) - S "\r$\\" ) ^ 1 ) -- $
2033                 + ocaml_string
2034                 + P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$" -- $
2035                 + EOL
2036             ) ^ 0
2037             * Q "*)"
2038     } )

```

The DefFunction

```

2039 local balanced_parens =
2040   P { "E" ,
2041       E =
2042         (
2043           P "(" * V "E" * P ")"
2044           +
2045           ( 1 - S "(" )
2046         ) ^ 0
2047   }

2176     + P "register" + P "restricted" + P "return" + P "static" + P "static_assert"
2177     + P "struct" + P "switch" + P "thread_local" + P "throw" + P "try"
2178     + P "typedef" + P "union" + P "using" + P "virtual" + P "volatile"
2179     + P "while"
2180   )
2181   + K ( 'Keyword.Constant' ,
2182     P "default" + P "false" + P "NULL" + P "nullptr" + P "true"
2183   )
2184
2185 local Builtin =
2186   K ( 'Name.Builtin' ,
2187     P "alignof" + P "malloc" + P "printf" + P "scanf" + P "sizeof"
2188   )
2189
2190 local Type =
2191   K ( 'Name.Type' ,
2192     P "bool" + P "char" + P "char16_t" + P "char32_t" + P "double"
2193     + P "float" + P "int" + P "int8_t" + P "int16_t" + P "int32_t"
2194     + P "int64_t" + P "long" + P "short" + P "signed" + P "unsigned"
2195     + P "void" + P "wchar_t"
2196   )
2197

```

³⁰Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

2198 local DefFunction =
2199     Type
2200     * Space
2201     * K ( 'Name.Function.Internal' , identifier )
2202     * SkipSpace
2203     * # P "("

```

We remind that the marker # of LPEG specifies that the pattern will be detected but won't consume any character.

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style Name.Class).

Example: `class myclass:`

```

2204 local DefClass =
2205     K ( 'Keyword' , P "class" ) * Space * K ( 'Name.Class' , identifier )

```

If the word `class` is not followed by an identifier, it will be caught as keyword by the LPEG Keyword (useful if we want to type a list of keywords).

The strings of C

```

2206 local String =
2207     WithStyle ( 'String.Long' ,
2208         Q "\""
2209         * ( VisualSpace
2210             + K ( 'String.Interpol' ,
2211                 P "%" * ( S "difcspXou" + P "ld" + P "li" + P "hd" + P "hi" )
2212             )
2213             + Q ( ( P "\\\"" + 1 - S " \"" ) ^ 1 )
2214             ) ^ 0
2215         * Q "\""
2216     )

```

Beamer The following LPEG `balanced_braces` will be used for the (mandatory) argument of the commands `\only` and `al.` of Beamer. It's necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it's known in the theory of formal languages that this can't be done with regular expressions *stricto sensu* only).

```

2348     * Lc '\@@_begin_line:'
2349     * SpaceIndentation ^ 0
2350     * MainLoopC
2351     * -1
2352     * Lc '\@@_end_line:'
2353   )
2354 languages['c'] = languageC

```

8.3.5 The LPEG language SQL

In the identifiers, we will be able to catch those containing spaces, that is to say like "last name".

```

2355 local identifier =
2356   letter * ( alphanum + P "-" ) ^ 0
2357   + P "'" * ( ( alphanum + space - P "'" ) ^ 1 ) * P "'"
2358
2359
2360 local Operator =
2361   K ( 'Operator' ,
2362     P "=" + P "!=" + P "<>" + P ">=" + P ">" + P "<=" + P "<" + S "*/"
2363   )

```

In SQL, the keywords are case-insensitive. That's why we have a little complication. We will catch the keywords with the identifiers and, then, distinguish the keywords with a Lua function. However, some keywords will be caught in special LPEG because we want to detect the names of the SQL tables.

```

2364 local function Set (list)
2365   local set = {}
2366   for _, l in ipairs(list) do set[l] = true end
2367   return set
2368 end
2369
2370 local set_keywords = Set
2371 {
2372   "ADD", "AFTER", "ALL", "ALTER", "AND", "AS", "ASC", "BETWEEN", "BY",
2373   "CHANGE", "COLUMN", "CREATE", "CROSS JOIN", "DELETE", "DESC", "DISTINCT",
2374   "DROP", "FROM", "GROUP", "HAVING", "IN", "INNER", "INSERT", "INTO", "IS",
2375   "JOIN", "LEFT", "LIKE", "LIMIT", "MERGE", "NOT", "NULL", "ON", "OR",
2376   "ORDER", "OVER", "RIGHT", "SELECT", "SET", "TABLE", "THEN", "TRUNCATE",

```

³²Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

2377     "UNION" , "UPDATE" , "VALUES" , "WHEN" , "WHERE" , "WITH"
2378 }
2379
2380 local set_builtins = Set
2381 {
2382     "AVG" , "COUNT" , "CHAR_LENGTH" , "CONCAT" , "CURDATE" , "CURRENT_DATE" ,
2383     "DATE_FORMAT" , "DAY" , "LOWER" , "LTRIM" , "MAX" , "MIN" , "MONTH" , "NOW" ,
2384     "RANK" , "ROUND" , "RTRIM" , "SUBSTRING" , "SUM" , "UPPER" , "YEAR"
2385 }

```

The LPEG Identifier will catch the identifiers of the fields but also the keywords and the built-in functions of SQL. It will *not* catch the names of the SQL tables.

```

2386 local Identifier =
2387     C ( identifier ) /
2388     (
2389         function (s)
2390             if set_keywords[string.upper(s)] -- the keywords are case-insensitive in SQL

```

Remind that, in Lua, it's possible to return *several* values.

```

2391         then return { "{\\PitonStyle{Keyword}{ " } ,
2392                     { luatexbase.catcodetables.other , s } ,
2393                     { "}" }
2394         else if set_builtins[string.upper(s)]
2395             then return { "{\\PitonStyle{Name.Builtin}{ " } ,
2396                         { luatexbase.catcodetables.other , s } ,
2397                         { "}" }
2398             else return { "{\\PitonStyle{Name.Field}{ " } ,
2399                         { luatexbase.catcodetables.other , s } ,
2400                         { "}" }
2401             end

```

We recall that each line in the SQL code we have to parse will be sent back to LaTeX between a pair `\\@@_begin_line: - \\@@_end_line:`³³.

```

2471     Ct (

```

³³Remember that the `\\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\\@@_begin_line:`

```

2472     Cc "EOL"
2473     *
2474     Ct (
2475         Lc "\\@@_end_line:"
2476         * BeamerEndEnvironments
2477         * BeamerBeginEnvironments
2478         * Lc "\\@@_newline: \\@@_begin_line:"
2479     )
2480 )
2481 )
2482 *
2483 SpaceIndentation ^ 0

```

The comments in the SQL listings We define different LPEG dealing with comments in the SQL listings.

```

2484 local CommentMath =
2485   P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$"
2486
2487 local Comment =
2488   WithStyle ( 'Comment' ,
2489     Q ( P "--" ) -- syntax of SQL92
2490     * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 )
2491   * ( EOL + -1 )
2492
2493 local LongComment =
2494   WithStyle ( 'Comment' ,
2495     Q ( P "/*" )
2496     * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
2497     * Q ( P "*/" )
2498   ) -- $

```

The following LPEG `CommentLaTeX` is for what is called in that document the “LaTeX comments”. Since the elements that will be caught must be sent to LaTeX with standard LaTeX catcodes, we put the capture (done by the function `C`) in a table (by using `Ct`, which is an alias for `lpeg.Ct`).

```

2499 local CommentLaTeX =
2500   P(piton.comment_latex)
2501   * Lc "{\\PitonStyle{Comment.LaTeX}{\\ignorespaces}"
2502   * L ( ( 1 - P "\r" ) ^ 0 )
2503   * Lc "}"
2504   * ( EOL + -1 )

```

The main LPEG for the language SQL

```

2505 local function LuaKeyword ( name )
2506   return
2507     Lc ( "{\\PitonStyle{Keyword}{}" )
2508     * Q ( Cmt (
2509         C ( identifier ) ,
2510         function(s,i,a) return string.upper(a) == name end
2511       )
2512     )
2513     * Lc ( "}" )
2514   end
2515
2516 local TableField =
2517   K ( 'Name.Table' , identifier )
2518   * Q ( P "." )
2519   * K ( 'Name.Field' , identifier )
2520
2521 local OneField =

```

```

2521 (
2522   Q ( P "(" * ( 1 - P )" ) ^ 0 * P ")" )
2523 +
2524   K ( 'Name.Table' , identifier )
2525   * Q ( P "." )
2526   * K ( 'Name.Field' , identifier )
2527 +
2528   K ( 'Name.Field' , identifier )
2529 )
2530 * (
2531   Space * LuaKeyword ( "AS" ) * Space * K ( 'Name.Field' , identifier )
2532 ) ^ -1
2533 * ( Space * ( LuaKeyword ( "ASC" ) + LuaKeyword ( "DESC" ) ) ) ^ -1
2534
2535 local OneTable =
2536   K ( 'Name.Table' , identifier )
2537   * (
2538     Space
2539     * LuaKeyword ( "AS" )
2540     * Space
2541     * K ( 'Name.Table' , identifier )
2542   ) ^ -1
2543
2544 local WeCatchTableNames =
2545   LuaKeyword ( "FROM" )
2546   * ( Space + EOL )
2547   * OneTable * ( SkipSpace * Q ( P "," ) * SkipSpace * OneTable ) ^ 0
2548   + (
2549     LuaKeyword ( "JOIN" ) + LuaKeyword ( "INTO" ) + LuaKeyword ( "UPDATE" )
2550     + LuaKeyword ( "TABLE" )
2551   )
2552   * ( Space + EOL ) * OneTable

```

First, the main loop :

```

2553 local MainSQL =
2554   EOL
2555   + Space
2556   + Tab
2557   + Escape + EscapeMath
2558   + CommentLaTeX
2559   + Beamer
2560   + Comment + LongComment
2561   + Delim
2562   + Operator
2563   + String
2564   + Punct
2565   + WeCatchTableNames
2566   + ( TableField + Identifier ) * ( Space + Operator + Punct + Delim + EOL + -1 )
2567   + Number
2568   + Word

```

Here, we must not put local!

```

2569 MainLoopSQL =
2570   ( ( space^1 * -1 )
2571     + MainSQL
2572   ) ^ 0

```

We recall that each line in the C code to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`³⁴.

```

2573 languageSQL =

```

³⁴Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

2574 Ct (
2575   ( ( space - P "\r" ) ^ 0 * P "\r" ) ^ -1
2576   * BeamerBeginEnvironments
2577   * Lc '\\@@_begin_line:'
2578   * SpaceIndentation ^ 0
2579   * MainLoopSQL
2580   * -1
2581   * Lc '\\@@_end_line:'
2582 )
2583 languages['sql'] = languageSQL

```

8.3.6 The function Parse

The function `Parse` is the main function of the package `piton`. It parses its argument and sends back to LaTeX the code with interlaced formatting LaTeX instructions. In fact, everything is done by the LPEG corresponding to the considered language (`languages[language]`) which returns as capture a Lua table containing data to send to LaTeX.

```

2584 function piton.Parse(language,code)
2585   local t = languages[language] : match ( code )
2586   if t == nil
2587   then
2588     tex.sprint("\\PitonSyntaxError")
2589     return -- to exit in force the function
2590   end
2591   local left_stack = {}
2592   local right_stack = {}
2593   for _ , one_item in ipairs(t)
2594   do
2595     if one_item[1] == "EOL"
2596     then
2597       for _ , s in ipairs(right_stack)
2598       do tex.sprint(s)
2599       end
2600       for _ , s in ipairs(one_item[2])
2601       do tex.tprint(s)
2602       end
2603       for _ , s in ipairs(left_stack)
2604       do tex.sprint(s)
2605       end
2606     else

```

Here is an example of an item beginning with "Open".

```
{ "Open" , "\begin{uncover}<2>" , "\end{cover}" }
```

In order to deal with the ends of lines, we have to close the environment (`{cover}` in this example) at the end of each line and reopen it at the beginning of the new line. That's why we use two Lua stacks, called `left_stack` and `right_stack`. `left_stack` will be for the elements like `\begin{uncover}<2>` and `right_stack` will be for the elements like `\end{cover}`.

```

2607     if one_item[1] == "Open"
2608     then
2609       tex.sprint( one_item[2] )
2610       table.insert(left_stack,one_item[2])
2611       table.insert(right_stack,one_item[3])
2612     else
2613       if one_item[1] == "Close"
2614       then
2615         tex.sprint( right_stack[#right_stack] )
2616         left_stack[#left_stack] = nil
2617         right_stack[#right_stack] = nil
2618       else
2619         tex.tprint(one_item)

```

```

2620         end
2621     end
2622 end
2623 end
2624 end

```

The function `ParseFile` will be used by the LaTeX command `\PitonInputFile`. That function merely reads the whole file (that is to say all its lines) and then apply the function `Parse` to the resulting Lua string.

```

2625 function piton.ParseFile(language,name,first_line,last_line)
2626     local s = ''
2627     local i = 0
2628     for line in io.lines(name)
2629     do i = i + 1
2630         if i >= first_line
2631         then s = s .. '\r' .. line
2632         end
2633         if i >= last_line then break end
2634     end

```

We extract the BOM of utf-8, if present.

```

2635     if string.byte(s,1) == 13
2636     then if string.byte(s,2) == 239
2637         then if string.byte(s,3) == 187
2638             then if string.byte(s,4) == 191
2639                 then s = string.sub(s,5,-1)
2640             end
2641         end
2642     end
2643     end
2644     piton.Parse(language,s)
2645 end

```

8.3.7 Two variants of the function `Parse` with integrated preprocessors

The following command will be used by the user command `\piton`. For that command, we have to undo the duplication of the symbols `#`.

```

2646 function piton.ParseBis(language,code)
2647     local s = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( code )
2648     return piton.Parse(language,s)
2649 end

```

The following command will be used when we have to parse some small chunks of code that have yet been parsed. They are re-scanned by LaTeX because it has been required by `\@@_piton:n` in the `piton` style of the syntactic element. In that case, you have to remove the potential `\@@_breakable_space:` that have been inserted when the key `break-lines` is in force.

```

2650 function piton.ParseTer(language,code)
2651     local s = ( Cs ( ( P '\\@@_breakable_space:' / ' ' + 1 ) ^ 0 ) )
2652             : match ( code )
2653     return piton.Parse(language,s)
2654 end

```

8.3.8 Preprocessors of the function `Parse` for gobble

We deal now with preprocessors of the function `Parse` which are needed when the “gobble mechanism” is used.

The function `gobble` gobbles n characters on the left of the code. It uses a LPEG that we have to compute dynamically because it depends on the value of n .

```

2655 local function gobble(n,code)
2656     function concat(acc,new_value)
2657         return acc .. new_value
2658     end
2659     if n==0
2660     then return code
2661     else
2662         return Cf (
2663             Cc ( "" ) *
2664             ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2665             * ( C ( P "\r" )
2666             * ( 1 - P "\r" ) ^ (-n)
2667             * C ( ( 1 - P "\r" ) ^ 0 )
2668             ) ^ 0 ,
2669             concat
2670             ) : match ( code )
2671     end
2672 end

```

The following function add will be used in the following LPEG AutoGobbleLPEG, TabsAutoGobbleLPEG and EnvGobbleLPEG.

```

2673 local function add(acc,new_value)
2674     return acc + new_value
2675 end

```

The following LPEG returns as capture the minimal number of spaces at the beginning of the lines of code. The main work is done by two *fold captures* (lpeg.Cf), one using add and the other (encompassing the previous one) using math.min as folding operator.

```

2676 local AutoGobbleLPEG =
2677     ( space ^ 0 * P "\r" ) ^ -1
2678     * Cf (
2679         (

```

We don't take into account the empty lines (with only spaces).

```

2680         ( P " " ) ^ 0 * P "\r"
2681         +
2682         Cf ( Cc(0) * ( P " " * Cc(1) ) ^ 0 , add )
2683         * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 * P "\r"
2684         ) ^ 0

```

Now for the last line of the Python code...

```

2685         *
2686         ( Cf ( Cc(0) * ( P " " * Cc(1) ) ^ 0 , add )
2687         * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 ) ^ -1 ,
2688         math.min
2689     )

```

The following LPEG is similar but works with the indentations.

```

2690 local TabsAutoGobbleLPEG =
2691     ( space ^ 0 * P "\r" ) ^ -1
2692     * Cf (
2693         (
2694             ( P "\t" ) ^ 0 * P "\r"
2695             +
2696             Cf ( Cc(0) * ( P "\t" * Cc(1) ) ^ 0 , add )
2697             * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 * P "\r"
2698             ) ^ 0
2699         *
2700         ( Cf ( Cc(0) * ( P "\t" * Cc(1) ) ^ 0 , add )
2701         * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 ) ^ -1 ,
2702         math.min
2703     )

```

The following LPEG returns as capture the number of spaces at the last line, that is to say before the `\end{Piton}` (and usually it's also the number of spaces before the corresponding `\begin{Piton}` because that's the traditionnal way to indent in LaTeX). The main work is done by a *fold capture* (`lpeg.Cf`) using the function `add` as folding operator.

```

2704 local EnvGobbleLPEG =
2705   ( ( 1 - P "\r" ) ^ 0 * P "\r" ) ^ 0
2706   * Cf ( Cc(0) * ( P " " * Cc(1) ) ^ 0 , add ) * -1

```

```

2707 function piton.GobbleParse(language,n,code)
2708   if n==--1
2709   then n = AutoGobbleLPEG : match(code)
2710   else if n==--2
2711     then n = EnvGobbleLPEG : match(code)
2712     else if n==--3
2713       then n = TabsAutoGobbleLPEG : match(code)
2714       end
2715     end
2716   end
2717   piton.Parse(language,gobble(n,code))
2718 end

```

8.3.9 To count the number of lines

```

2719 function piton.CountLines(code)
2720   local count = 0
2721   for i in code : gmatch ( "\r" ) do count = count + 1 end
2722   tex.sprint(
2723     luatexbase.catcodetables.expl ,
2724     '\\int_set:Nn \\l_@@_nb_lines_int {' .. count .. '}' )
2725 end

2726 function piton.CountNonEmptyLines(code)
2727   local count = 0
2728   count =
2729   ( Cf ( Cc(0) *
2730     (
2731       ( P " " ) ^ 0 * P "\r"
2732       + ( 1 - P "\r" ) ^ 0 * P "\r" * Cc(1)
2733     ) ^ 0
2734     * ( 1 - P "\r" ) ^ 0 ,
2735     add
2736   ) * -1 ) : match (code)
2737   tex.sprint(
2738     luatexbase.catcodetables.expl ,
2739     '\\int_set:Nn \\l_@@_nb_non_empty_lines_int {' .. count .. '}' )
2740 end

2741 function piton.CountLinesFile(name)
2742   local count = 0
2743   io.open(name) -- added
2744   for line in io.lines(name) do count = count + 1 end
2745   tex.sprint(
2746     luatexbase.catcodetables.expl ,
2747     '\\int_set:Nn \\l_@@_nb_lines_int {' .. count .. '}' )
2748 end

2749 function piton.CountNonEmptyLinesFile(name)
2750   local count = 0
2751   for line in io.lines(name)
2752   do if not ( ( ( P " " ) ^ 0 * -1 ) : match ( line ) )

```

```

2753     then count = count + 1
2754   end
2755 end
2756 tex.sprint(
2757   luatexbase.catcodetables.expl ,
2758   '\\int_set:Nn \\l_@@_nb_non_empty_lines_int {' .. count .. '}' )
2759 end

```

The following function stores in `\l_@@_first_line_int` and `\l_@@_last_line_int` the numbers of lines of the file `file_name` corresponding to the strings `marker_beginning` and `marker_end`.

```

2760 function piton.ComputeRange(marker_beginning,marker_end,file_name)
2761   local s = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_beginning )
2762   local t = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_end )
2763   local first_line = -1
2764   local count = 0
2765   local last_found = false
2766   for line in io.lines(file_name)
2767   do if first_line == -1
2768     then if string.sub(line,1,#s) == s
2769       then first_line = count
2770       end
2771     else if string.sub(line,1,#t) == t
2772       then last_found = true
2773       break
2774     end
2775   end
2776   count = count + 1
2777 end
2778 if first_line == -1
2779 then tex.sprint("\\PitonBeginMarkerNotFound")
2780 else if last_found == false
2781   then tex.sprint("\\PitonEndMarkerNotFound")
2782   end
2783 end
2784 tex.sprint(
2785   luatexbase.catcodetables.expl ,
2786   '\\int_set:Nn \\l_@@_first_line_int {' .. first_line .. ' + 2 }'
2787   .. '\\int_set:Nn \\l_@@_last_line_int {' .. count .. '}' )
2788 end
2789 </LUA>

```

9 History

The successive versions of the file `piton.sty` provided by TeXLive are available on the SVN server of TeXLive:

<https://tug.org/svn/texlive/trunk/Master/texmf-dist/tex/lualatex/piton/piton.sty>

The development of the extension `piton` is done on the following GitHub repository:

<https://github.com/fpantigny/piton>

Changes between versions 2.1 and 2.2

New key path for `\PitonOptions`.

New language SQL.

It's now possible to define styles locally to a given language (with the optional argument of `\SetPitonStyle`).

Changes between versions 2.0 and 2.1

The key `line-numbers` has now subkeys `line-numbers/skip-empty-lines`, `line-numbers/label-empty-lines`, etc.

The key `all-line-numbers` is deprecated: use `line-numbers/skip-empty-lines=false`.

New system to import, with `\PitonInputFile`, only a part (of the file) delimited by textual markers.

New keys `begin-escape`, `end-escape`, `begin-escape-math` and `end-escape-math`.

The key `escape-inside` is deprecated: use `begin-escape` and `end-escape`.

Changes between versions 1.6 and 2.0

The extension `piton` now supports the computer languages OCaml and C (and, of course, Python).

Changes between versions 1.5 and 1.6

New key `width` (for the total width of the listing).

New style `UserFunction` to format the names of the Python functions previously defined by the user.

Command `\PitonClearUserFunctions` to clear the list of such functions names.

Changes between versions 1.4 and 1.5

New key `numbers-sep`.

Changes between versions 1.3 and 1.4

New key `identifiers` in `\PitonOptions`.

New command `\PitonStyle`.

`background-color` now accepts as value a *list* of colors.

Changes between versions 1.2 and 1.3

When the class `Beamer` is used, the environment `{Piton}` and the command `\PitonInputFile` are “overlay-aware” (that is to say, they accept a specification of overlays between angular brackets).

New key `prompt-background-color`

It’s now possible to use the command `\label` to reference a line of code in an environment `{Piton}`.

A new command `_` is available in the argument of the command `\piton{...}` to insert a space (otherwise, several spaces are replaced by a single space).

Changes between versions 1.1 and 1.2

New keys `break-lines-in-piton` and `break-lines-in-Piton`.

New key `show-spaces-in-string` and modification of the key `show-spaces`.

When the class `beamer` is used, the environments `{uncoverenv}`, `{onlyenv}`, `{visibleenv}` and `{invisibleenv}`

Changes between versions 1.0 and 1.1

The extension `piton` detects the class `beamer` and activates the commands `\action`, `\alert`, `\invisible`, `\only`, `\uncover` and `\visible` in the environments `{Piton}` when the class `beamer` is used.

Changes between versions 0.99 and 1.0

New key `tabs-auto-gobble`.

Changes between versions 0.95 and 0.99

New key `break-lines` to allow breaks of the lines of code (and other keys to customize the appearance).

Changes between versions 0.9 and 0.95

New key `show-spaces`.

The key `left-margin` now accepts the special value `auto`.

New key `latex-comment` at load-time and replacement of `##` by `#>`

New key `math-comments` at load-time.

New keys `first-line` and `last-line` for the command `\InputPitonFile`.

Changes between versions 0.8 and 0.9

New key `tab-size`.

Integer value for the key `splittable`.

Changes between versions 0.7 and 0.8

New keys `footnote` and `footnotehyper` at load-time.

New key `left-margin`.

Changes between versions 0.6 and 0.7

New keys `resume`, `splittable` and `background-color` in `\PitonOptions`.

The file `piton.lua` has been embedded in the file `piton.sty`. That means that the extension `piton` is now entirely contained in the file `piton.sty`.
