

The `textgreek` package*

Leonard Michlmayr
leonard.michlmayr at gmail.com

2011/10/09

Abstract

The \LaTeX package `textgreek` provides NFSS text symbols for Greek letters. This way the author can use Greek letters in text without changing to math mode. The usual font selection commands—e.g. `\textbf`—apply to these Greek letters as to usual text and the font is upright in an upright environment. Further, `hyperref` can use these symbols in PDF-strings such as PDF-bookmarks.

*This document corresponds to `textgreek` v0.7, dated 2011/10/09.

1 Introduction

The usual way to print Greek letters in \LaTeX uses the math mode. E.g. \beta produces β . With the default math fonts, the Greek letters produced this way are *italic*. Generally, this is ok, since they represent variables and variables are typeset italic with the default math font settings. In some circumstances, however, Greek letters don't represent variables and should be typeset upright. E.g. in “ β -decay” or “ μA ”.

The package `upgreek` provides commands to set upright Greek letters in math mode, but it does not provide text symbols. You could use them in text with \upbeta -decay, for example, which gives β -decay, but the font will always be the same and will not be adapted to the surrounding font.

The package `textgreek` provides text commands for Greek letters in text that adapt to the surrounding font. For example in **bold text**, the command `\textbeta` gives β while \upbeta gives β .

As textsymbols, Greek letters can also be used in unicode PDF-strings, for example in PDF-bookmarks provided by the `hyperref` package. See section 4.

2 Usage

The following list shows the commands provided by this package. You can use these commands in any context.

<code>\textalpha</code>	α	<code>\texttau</code>	τ	<code>\textXi</code>	Ξ
<code>\textbeta</code>	β	<code>\textupsilon</code>	υ	<code>\textOmicron</code>	O
<code>\textgamma</code>	γ	<code>\textphi</code>	φ	<code>\textPi</code>	Π
<code>\textdelta</code>	δ	<code>\textchi</code>	χ	<code>\textRho</code>	P
<code>\textepsilon</code>	ϵ	<code>\textpsi</code>	ψ	<code>\textSigma</code>	Σ
<code>\textzeta</code>	ζ	<code>\textomega</code>	ω	<code>\textTau</code>	T
<code>\texteta</code>	η	<code>\textAlpha</code>	A	<code>\textUpsilon</code>	Υ
<code>\texttheta</code>	θ	<code>\textBeta</code>	B	<code>\textPhi</code>	Φ
<code>\textiota</code>	ι	<code>\textGamma</code>	Γ	<code>\textChi</code>	X
<code>\textkappa</code>	κ	<code>\textDelta</code>	Δ	<code>\textPsi</code>	Ψ
<code>\textlambda</code>	λ	<code>\textEpsilon</code>	E	<code>\textOmega</code>	Ω
<code>\textmu</code>	μ	<code>\textZeta</code>	Z		
<code>\textmugreek</code>	μ	<code>\textEta</code>	H	<code>\textvarsigma</code>	ς
<code>\textnu</code>	ν	<code>\textTheta</code>	Θ	<code>\straightphi</code>	ϕ
<code>\textxi</code>	ξ	<code>\textIota</code>	I	<code>\scripttheta</code>	ϑ
<code>\textomikron</code>	o	<code>\textKappa</code>	K	<code>\straighttheta</code>	θ
<code>\textpi</code>	π	<code>\textLambda</code>	Λ	<code>\straightepsilon</code>	ϵ
<code>\textrho</code>	ρ	<code>\textMu</code>	M		
<code>\textsigma</code>	σ	<code>\textNu</code>	N		

The `textcomp` package also defines `\textmu`. `textgreek` will not replace a prior definition of `\textmu` if recognized. Therefore it is often better to use `\textmugreek` instead to avoid unexpected results.

2.1 Package Options

You can choose the Greek fonts used.

cbgreek use the default fonts. This option is the default. Font sample: αβγδε
ζηθικ λμνξο πρστυ φχψω ΑΒΓΔΕ ΖΗΘΙΚ ΛΜΝΞΟ ΠΡΣΤΥ ΦΧΨΩ ςφθθε

euler use the Euler fonts as a companion for all fonts except Helvetica. Font sam-
ple: αβγδε ζηθικ λμνξο πρστυ φχψω ΑΒΓΔΕ ΖΗΘΙΚ ΛΜΝΞΟ ΠΡΣΤΥ
ΦΨΩ φθθε

artemisia use Artemisia fonts as a companion for all fonts except Helvetica
and Euler. Font sample: αβγδε ζηθικ λμνξο πρστυ φχψω ΑΒΓΔΕ ΖΗΘΙΚ
ΛΜΝΞΟ ΠΡΣΤΥ ΦΧΨΩ ςφθθε

2.2 Advanced commands

`\textgreekfontmap` The package provides a number of options that allows to select a font that will
be used. The list of font substitutions is written to the log file. If you need
to customize the font substitutions, you can redefine `\textgreekfontmap`. For
example, the font map for the option `euler` may also be set by:

```
\renewcommand*\textgreekfontmap{\  
  {phv/*/*}{U/psy/*/*}  
  {*/bx/n}{U/eur/b/n}  
  {*/b/n}{U/eur/b/n}  
  {*/*/n}{U/eur/m/n}  
  {*/*/it}{OML/*/*/*}}
```

The list contains pairs of options: the font spec (without the encoding) of the
font to be replaced and the font spec (with encoding) of the font to be used as
companion. The wildcard `*` may be used to match any family, series, or shape
respectively. The first match is effective. Fonts that do not matched at all will be
substituted with the same font-family, font-series, and font-shape in the encoding
LGR. Since the Euler font (`eur`) does not use the encoding LGR, it has to be
replaced by `U/eur/m/n`.

3 Examples

Most users will use this package to get upright Greek letters, but you can use it
for italic letters too: for example `\textit{\textdelta}` δ.

When you are using Helvetica, the font “Symbol” is used for Greek letters:
αβγδε ζηθικ λμνξο πρστυ φχψω ΑΒΓΔΕ ΖΗΘΙΚ ΛΜΝΞΟ ΠΡΣΤΥ ΦΧΨΩ ςφθθε

Remember that \TeX skips over whitespace directly following a command. Add
`{}` to get an interword space after a command. E.g. σ is generated by `\textsigma{}`.

3.1 Use “β-decay” in a heading

The command used for the heading was

```
\subsection{Use \textquotedblleft\textbeta  
-decay\textquotedblright {} in a heading}
```

4 Compatibility

If you use the package `hyperref` I recommend to use the option `unicode`, i.e. `\usepackage[unicode]{hyperref}`. `Hyperref` will recognize the `textgreek` letters and replace them with `unicode` in PDF-strings.

You can use `upgreek` and `textgreek` in the same document. If you want to use a `textgreek` letter inside a `math` environment, you can place it into an `\mbox` or `\textnormal`, or use `\text` from the package `amstext`, e.g. `$$\lambda_{\text{\textbeta}}$$`: λ_{β} .

5 Limitations

The variants θ , ϕ , and ϵ are not included in the LGR font encoding and ϵ is not included in `Symbol` either. For the commands `\straighttheta`, `\straightphi`, and `\straightepsilon` the missing symbols are substituted from `OML/*/*/it` or `Euler`.

You may need to customize `\textgreekfontmap` if you use other fonts than `Computer Modern` and `Latin Modern`.

The version number of this package is still below 1.0. Many details may still change from version to version.

7 Implementation

Load the LGR font encoding.

```
1 \InputIfFileExists{lgrenc.def}{%
2   \PackageInfo{textgreek}{Loading the definitions for the Greek font%
3     encoding.}}{%
4   \PackageError{textgreek}{Cannot find the file lgrenc.def}{%
5     lgrenc.def is a file that contains the definitions for the Greek
6     font encoding LGR. Maybe it comes with the babel package.}}
```

7.1 Package Options

```
7 \DeclareOption{cbgreek}{%
8   \renewcommand*{\textgreekfontmap}{%
```

```

9 {eur/**}{U/eur/**}
10 {phv/**}{U/psy/**}}%
11 \DeclareOption{euler}{%
12 \renewcommand*\textgreekfontmap{%
13 {phv/**}{U/psy/**}
14 {*/bx/n}{U/eur/b/n}
15 {*/b/n}{U/eur/b/n}
16 {*/*/n}{U/eur/m/n}
17 {*/*/it}{OML/**/**}}%
18 \DeclareOption{artemisia}{%
19 \renewcommand*\textgreekfontmap{%
20 {eur/**}{U/eur/**}
21 {phv/**}{U/psy/**}
22 {*/b/n}{LGR/artemisia/b/n}
23 {*/bx/n}{LGR/artemisia/bx/n}
24 {*/*/n}{LGR/artemisia/m/n}
25 {*/b/it}{LGR/artemisia/b/it}
26 {*/bx/it}{LGR/artemisia/bx/it}
27 {*/*/it}{LGR/artemisia/m/it}
28 {*/b/sl}{LGR/artemisia/b/sl}
29 {*/bx/sl}{LGR/artemisia/bx/sl}
30 {*/*/sl}{LGR/artemisia/m/sl}
31 {*/*/sc}{LGR/artemisia/m/sc}
32 {*/*/sco}{LGR/artemisia/m/sco}}%

```

`\textgreekfontmap` Initialize `\textgreekfontmap`, set the default option and process the options.

```

33 \newcommand*\textgreekfontmap{}%
34 \ExecuteOptions{cbgreek}
35 \ProcessOptions\relax%
36 \PackageInfo{textgreek}{Loaded fontmap: \textgreekfontmap.}

```

7.2 Font selection

`\textgreek@findfont` Chose a companion font.

```

37 \def\textgreek@setfont#1/#2/#3/#4\relax{%
38 \textgreek@ematch{#1}{*}{*}{\fontencoding{#1}}%
39 \textgreek@ematch{#2}{*}{*}{\fontfamily{#2}}%
40 \textgreek@ematch{#3}{*}{*}{\fontseries{#3}}%
41 \textgreek@ematch{#4}{*}{*}{\fontshape{#4}}%

```

Process a list of font substitutions.

```
